

The following document contains information on Cypress products. Although the document is marked with the name "Spansion" and "Fujitsu", the company that originally developed the specification, Cypress will continue to offer these products to new and existing customers.

## Continuity of Specifications

There is no change to this document as a result of offering the device as a Cypress product. Any changes that have been made are the result of normal document improvements and are noted in the document history page, where supported. Future revisions will occur when appropriate, and changes will be noted in a document history page.

## Continuity of Ordering Part Numbers

Cypress continues to support existing part numbers. To order these products, please use only the Ordering Part Numbers listed in this document.

## For More Information

Please contact your local sales office for additional information about Cypress products and solutions.

## About Cypress

Cypress (NASDAQ: CY) delivers high-performance, high-quality solutions at the heart of today's most advanced embedded systems, from automotive, industrial and networking platforms to highly interactive consumer and mobile devices. With a broad, differentiated product portfolio that includes NOR flash memories, F-RAM ${ }^{\text {TM }}$ and SRAM, Traveo ${ }^{\text {TM }}$ microcontrollers, the industry's only PSoC ${ }^{\circledR}$ programmable system-on-chip solutions, analog and PMIC Power Management ICs, CapSense ${ }^{\circledR}$ capacitive touch-sensing controllers, and Wireless BLE Bluetooth ${ }^{\circledR}$ Low-Energy and USB connectivity solutions, Cypress is committed to providing its customers worldwide with consistent innovation, best-in-class support and exceptional system value.

## ASSP for Power Management Applications 1 ch DC/DC Converter IC Built-in Switching FET \& POWERGOOD function, PFM/PWM Synchronous Rectification, and Down Conversion Support

## MB39C006A

## DESCRIPTION

The MB39C006A is a current mode type 1-channel DC/DC converter IC built-in switching FET, synchronous rectification, and down conversion support. The device is integrated with a switching FET, oscillator, error amplifier, PFM/PWM control circuit, reference voltage source, and POWERGOOD circuit.
External inductor and decoupling capacitor are needed only for the external component.
MB39C006A is small, achieve a highly effective DC/DC converter in the full load range, this is suitable as the built-in power supply for handheld equipment such as mobile phone/PDA, DVDs, and HDDs.

## ■ FEATURES

- High efficiency
- Low current consumption
- Output current (DC/DC)
- Input voltage range
- Operating frequency
- Built-in PWM operation fixed function
- No flyback diode needed
- Low dropout operation
: For 100\% on duty
- Built-in high-precision reference voltage generator : $1.20 \mathrm{~V} \pm 2 \%$
- Consumption current in shutdown mode $: 1 \mu \mathrm{~A}$ or less
- Built-in switching FET : P-ch MOS $0.3 \Omega$ (Typ) N-ch MOS $0.2 \Omega$ (Typ)
- High speed for input and load transient response in the current mode
- Over temperature protection
- Packaged in a compact package
: SON10

## ■ APPLICATIONS

- Flash ROMs
- MP3 players
- Electronic dictionary devices
- Surveillance cameras
- Portable GPS navigators
- Mobile phones
etc.

## PIN ASSIGNMENT

- PIN DESCRIPTIONS

| Pin No | Pin name | I/O | Description |
| :---: | :---: | :---: | :--- |
| 1 | LX | O | Inductor connection output pin. High impedance during shut down. |
| 2 | GND | - | Ground pin. |
| 3 | CTL | I | Control input pin. (L : Shut down / H : Normal operation) |
| 4 | VREF | O | Reference voltage output pin. |
| 5 | POWERGOOD | O | POWERGOOD circuit output pin. Internally connected to an N-ch MOS open <br> drain circuit. |
| 6 | FSEL | I | Frequency switch pin. <br> (L (open) : 2.0 MHz, H : 3.2 MHz) |
| 7 | VREFIN | I | Error amplifier (Error Amp) non-inverted input pin. |
| 8 | MODE | I | Operation mode switch pin. <br> (L : PFM/PWM mode, OPEN : PWM mode) |
| 9 | OUT | I | Output voltage feedback pin. |
| 10 | VDD | - | Power supply pin. |

## BLOCK DIAGRAM

## MB39C006A

## - Current mode

- Original voltage mode type:

Stabilize the output voltage by comparing two items below and on-duty control.

- Voltage (Vc) obtained through negative feedback of the output voltage by Error Amp
- Reference triangular wave (VTRI)
- Current mode type:

Instead of the triangular wave ( $\mathrm{V}_{\text {TRII }}$ ), the voltage ( $\mathrm{V}_{\text {IDET }}$ ) obtained through I-V conversion of the sum of currents that flow in the oscillator (rectangular wave generation circuit) and SW FET is used.
Stabilize the output voltage by comparing two items below and on-duty control.

- Voltage (Vc) obtained through negative feedback of the output voltage by Error Amp
- Voltage (VIDET) obtained through I-V conversion of the sum of current that flow in the oscillator (rectangular wave generation circuit) and SW FET

Note : The above models illustrate the general operation and an actual operation will be preferred in the IC.

## MB39C006A

## FUNCTION OF EACH BLOCK

## - PFM/PWM Logic control circuit

In normal operation, frequency ( $2.0 \mathrm{MHz} / 3.2 \mathrm{MHz}$ ) which is set by the built-in oscillator (square wave oscillation circuit) controls the built-in P-ch MOS FET and N-ch MOS FET for the synchronous rectification operation. In the light load mode, the intermittent (PFM) operation is executed.
This circuit protects against pass-through current caused by synchronous rectification and against reverse current caused in a non-successive operation mode.

- lout comparator circuit

This circuit detects the current (llx) which flows to the external inductor from the built-in P-ch MOS FET.
By comparing VIDET obtained through I-V conversion of peak current Ipk of lıx with the Error Amp output, the builtin P-ch MOS FET is turned off via the PFM/PWM Logic Control circuit.

## - Error Amp phase compensation circuit

This circuit compares the output voltage to reference voltages such as VREF. The MB39C006A has a built-in phase compensation circuit that is designed to optimize the operation of the MB39C006A. This needs neither to be considered nor addition of a phase compensation circuit and an external phase compensation device.

## - VREF circuit

A high accuracy reference voltage is generated with BGR (bandgap reference) circuit. The output voltage is 1.20 V (Typ).

## - POWERGOOD circuit

The POWERGOOD circuit monitors the voltage at the OUT pin. The POWERGOOD pin is open drain output. Use the pin with pull-up using the external resistor in the normal operation.
When the CTL is at the H level, the POWERGOOD pin becomes the H level. However, if the output voltage drops because of over current and etc, the POWERGOOD pin becomes the L level.

Timing chart example : (POWERGOOD pin pulled up to VIN)

## MB39C006A

## - Protection circuit

The MB39C006A has a built-in over-temperature protection circuit.
The over-temperature protection circuit turns off both N -ch and P -ch switching FETs when the junction
temperature reaches $+135^{\circ} \mathrm{C}$. When the junction temperature drops to $+110^{\circ} \mathrm{C}$, the switching FET returns to the normal operation.
Since the PFM/PWM control circuit of the MB39C006A is in the control method in current mode, the current peak value is also monitored and controlled as required.

- FUNCTION TABLE

| MODE | Input |  |  | Output |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Switching <br> frequency | CTL | MODE | FSEL | OUTPUT pin <br> voltage | VREF | POWERGOOD |
| Shutdown <br> mode | - | L | $*$ | $*$ | Output stop | Output <br> stop | Function stop |
| PFM/PWM <br> mode | 2.0 MHz | H | L | L | VOUT voltage <br> output | 1.2 V | Operation |
| PWM fixed <br> mode | 2.0 MHz | H | OPEN | L | VOUT voltage <br> output | 1.2 V | Operation |
| PFM/PWM <br> mode | 3.2 MHz | H | L | H | VOUT voltage <br> output | 1.2 V | Operation |
| PWM fixed <br> mode | 3.2 MHz | H | OPEN | H | VOUT voltage <br> output | 1.2 V | Operation |

*1: See " $\boldsymbol{\text { E EXAMPLE OF STANDARD OPERATION CHARACTERISTICS • Power dissipation vs. Operating }}$ ambient temperature" for the package power dissipation of Ta from $+25^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.
*2 : When mounted on a four- layer epoxy board of $11.7 \mathrm{~cm} \times 8.4 \mathrm{~cm}$
*3: IC is mounted on a four-layer epoxy board, which has thermal via, and the IC's thermal pad is connected to the epoxy board (Thermal via is 4 holes).
*4: IC is mounted on a four-layer epoxy board, which has no thermal via, and the IC's thermal pad is connected to the epoxy board.

Notes - The use of negative voltages below -0.3 V to the GND pin may create parasitic transistors on LSI lines, which can cause abnormal operation.

- This device can be damaged if the LX pin is short-circuited to VDD pin or GND pin.
- Take measures not to keep the FSEL pin falling below the GND pin potential of the MB39C006A as much as possible.
In addition to erroneous operation, the IC may latch up and destroy itself if 110 mA or more current flows from this pin.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Condition | Value |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Min | Typ | Max |  |
| Power supply voltage | Vod | - | 2.5 | 3.7 | 5.5 | V |
| VREFIN voltage | Vrefin | - | 0.15 | - | 1.20 | V |
| CTL voltage | Vcti | - | 0 | - | 5.0 | V |
| LX current | ILx | - | - | - | 800 | mA |
| POWERGOOD current | IPG | - | - | - | 1 | mA |
| VREF output current | Irout | $2.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 3.0 \mathrm{~V}$ | - | - | 0.5 | mA |
|  |  | $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V}$ | - | - | 1 |  |
| Inductor value | L | fosc $1=2.0 \mathrm{MHz}($ (FSEL $=$ L) | - | 2.2 | - | $\mu \mathrm{H}$ |
|  |  | fosc2 $=3.2 \mathrm{MHz}($ FSEL $=\mathrm{H})$ | - | 1.5 | - |  |

Note : The output current from this device has a situation to decrease if the power supply voltage (Viv) and the DC/DC converter output voltage (Vout) differ only by a small amount. This is a result of slope compensation and will not damage this device.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.
Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.
No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

## APPLICATION NOTES

## [1] Selection of components

- Selection of an external inductor

Basically it dose not need to design inductor. The MB39C006A is designed to operate efficiently with a $2.2 \mu \mathrm{H}$ (2.0 MHz operation) or $1.5 \mu \mathrm{H}$ (3.2 MHz operation) external inductor.

The inductor should be rated for a saturation current higher than the LX peak current value during normal operating conditions, and should have a minimal DC resistance. ( $100 \mathrm{~m} \Omega$ or less is recommended.)
The LX peak current value lpk is obtained by the following formula.

L : External inductor value
lout : Load current
Vin : Power supply voltage
Vout : Output setting voltage
D : ON- duty to be switched( = Vout $/ \mathrm{V}$ iv)
fosc : Switching frequency ( 2.0 MHz or 3.2 MHz )
ex) At $\mathrm{V}_{\mathrm{I}}=3.7 \mathrm{~V}$, $\mathrm{V}_{\text {out }}=2.5 \mathrm{~V}$, lout $=0.8 \mathrm{~A}, \mathrm{~L}=2.2 \mu \mathrm{H}$, fosc $=2.0 \mathrm{MHz}$
The maximum peak current value $\mathrm{I}_{\mathrm{\digamma}}$;

$$
\text { IPK }=\text { lout }+\frac{\left(\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {OUT }}\right) \times \mathrm{V}_{\text {OUT }}}{2 \times \mathrm{L} \times \text { fosc } \times \mathrm{V}_{\text {IN }}}=0.8 \mathrm{~A}+\frac{(3.7 \mathrm{~V}-2.5 \mathrm{~V}) \times 2.5 \mathrm{~V}}{2 \times 2.2 \mu \mathrm{H} \times 2.0 \mathrm{MHz} \times 3.7 \mathrm{~V}} \div 0.89 \mathrm{~A}
$$

- I/O capacitor selection
- Select a low equivalent series resistance (ESR) for the VDD input capacitor to suppress dissipation from ripple currents.
- Also select a low equivalent series resistance (ESR) for the output capacitor. The variation in the inductor current causes ripple currents on the output capacitor which, in turn, causes ripple voltages an output equal to the amount of variation multiplied by the ESR value. The output capacitor value has a significant impact on the operating stability of the device when used as a DC/DC converter. Therefore, FUJITSU MICROELECTRONICS generally recommends a $4.7 \mu \mathrm{~F}$ capacitor, or a larger capacitor value can be used if ripple voltages are not suitable. If the $\mathrm{V}_{\mathrm{II}} / \mathrm{V}_{\text {out }}$ voltage difference is within 0.6 V , the use of a $10 \mu \mathrm{~F}$ output capacitor value is recommended.
- Types of capacitors

Ceramic capacitors are effective for reducing the ESR and afford smaller DC/DC converter circuit. However, power supply functions as a heat generator, therefore avoid to use capacitor with the F-temperature rating ( $-80 \%$ to $+20 \%$ ). FUJITSU MICROELECTRONICS recommends capacitors with the B-temperature rating ( $\pm 10 \%$ to $\pm 20 \%$ ).
Normal electrolytic capacitors are not recommended due to their high ESR.
Tantalum capacitor will reduce ESR, however, it is dangerous to use because it turns into short mode when damaged. If you insist on using a tantalum capacitor, FUJITSU MICROELECTRONICS recommends the type with an internal fuse.

## MB39C006A

## [2] Output voltage setting

The output voltage Vout of the MB39C006A is defined by the voltage input to VREFIN. Supply the voltage for inputting to VREFIN from an external power supply, or set the VREF output by dividing it with resistors.
The output voltage when the VREFIN voltage is set by dividing the VREF voltage with resistors is shown in the following formula.

$$
\mathrm{V}_{\text {OUT }}=2.97 \times \mathrm{V}_{\text {REFIN }}, \quad \mathrm{V}_{\text {REFIN }}=\frac{\mathrm{R} 4}{\mathrm{R} 3+\mathrm{R} 4} \times \mathrm{V}_{\text {REF }}
$$

$$
\left(\mathrm{V}_{\text {REF }}=1.20 \mathrm{~V}\right)
$$

Note : See "■ APPLICATIN CIRCUIT EXAMPLES" for an example of this circuit.

Although the output voltage is defined according to the dividing ratio of resistance, select the resistance value so that the current flowing through the resistance does not exceed the VREF current rating ( 1 mA ).

## [3] About conversion efficiency

The conversion efficiency can be improved by reducing the loss of the DC/DC converter circuit.
The total loss (PLoss) of the DC/DC converter is roughly divided as follows :

Ploss $=\mathrm{P}_{\text {cont }}+\mathrm{Psw}+\mathrm{Pc}$

Pcont : Control system circuit loss (The power to operate the MB39C006A, including the gate driving power for internal SW FETs)
Psw : Switching loss (The loss caused during the switch of the IC's internal SW FETs)
Pc : Continuity loss (The loss caused when currents flow through the IC's internal SW FETs and external circuits )

The IC's control circuit loss (Pcont) is extremely small, several tens of $\mathrm{mW}^{*}$ with no load.
As the IC contains FETs which can switch faster with less power, the continuity loss $\left(\mathrm{Pc}_{\mathrm{c}}\right)$ is more predominant as the loss during heavy-load operation than the control circuit loss (Pcont) and switching loss (Psw).
*: The loss in the successive operation mode. This IC suppresses the loss in order to execute the PFM operation in the low load mode (less than $100 \mu \mathrm{~A}$ in no load mode). Mode is changed by the current peak value lok which flows into switching FET. The threshold value is about 30 mA .

Furthermore, the continuity loss $\left(\mathrm{P}_{\mathrm{c}}\right)$ is divided roughly into the loss by internal SW FET ON-resistance and by external inductor series resistance.
$\mathrm{Pc}=$ lout $^{2} \times($ RDC $+\mathrm{D} \times$ Ronp $+(1-\mathrm{D}) \times$ Ronn $)$
D : Switching ON-duty cycle ( = Vout / Vin)
Ronp : Internal P-ch SW FET ON resistance
Ronn : Internal N-ch SW FET ON resistance
RDC : External inductor series resistance
lout : Load current

The above formula indicates that it is important to reduce RDC as much as possible to improve efficiency by selecting components.

## [4] Power dissipation and heat considerations

The IC is so efficient that no consideration is required in most of the cases. However, if the IC is used at a low power supply voltage, heavy load, high output voltage, or high temperature, it requires further consideration for higher efficiency.
The internal loss $(P)$ is roughly obtained from the following formula :

$$
P=\text { lout }^{2} \times(\mathrm{D} \times \text { Ronp }+(1-\mathrm{D}) \times \text { Ronn })
$$

D : Switching ON-duty cycle ( = Vout / Viv)
Ronp : Internal P-ch SW FET ON resistance
Ronn : Internal N-ch SW FET ON resistance
lout : Output current
The loss expressed by the above formula is mainly continuity loss. The internal loss includes the switching loss and the control circuit loss as well but they are so small compared to the continuity loss they can be ignored.
In the MB39C006A with Ronp greater than Ronn, the larger the on-duty cycle, the greater the loss.
When assuming $\mathrm{V}_{\mathrm{in}}=3.7 \mathrm{~V}, \mathrm{Ta}=+70^{\circ} \mathrm{C}$ for example, Ronp $=0.42 \Omega$ and Ronn $=0.36 \Omega$ according to the graph "MOS FET ON resistance vs. Operating ambient temperature". The IC's internal loss P is 144 mW at Vout $=2.5$ V and lout $=0.6 \mathrm{~A}$. According to the graph "Power dissipation vs. Operating ambient temperature", the power dissipation at an operating ambient temperature Ta of $+70^{\circ} \mathrm{C}$ is 539 mW and the internal loss is smaller than the power dissipation.

## MB39C006A

## [5] Transient response

Normally, lout is suddenly changed while $\mathrm{VIN}_{\mathrm{I}}$ and Vout are maintained constant, responsiveness including the response time and overshoot/undershoot voltage is checked. As the MB39C006A has built-in Error Amp with an optimized design, it shows good transient response characteristics. However, if ringing upon sudden change of the load is high due to the operating conditions, add capacitor C6 (e.g. $0.1 \mu \mathrm{~F}$ ). (Since this capacitor C6 changes the start time, check the start waveform as well.) This action is not required for DAC input.

## [6] Board layout, design example

The board layout needs to be designed to ensure the stable operation of the MB39C006A.
Follow the procedure below for designing the layout.

- Arrange the input capacitor ( Cin ) as close as possible to both the VDD and GND pins. Make a through hole (TH) near the pins of this capacitor if the board has planes for power and GND.
- Large AC currents flow between the MB39C006A and the input capacitor (Cin), output capacitor (Co), and external inductor (L). Group these components as close as possible to the MB39C006A to reduce the overall loop area occupied by this group. Also try to mount these components on the same surface and arrange wiring without through hole wiring. Use thick, short, and straight routes to wire the net (The layout by planes is recommended.).
- The feedback wiring to the OUT should be wired from the voltage output pin closest to the output capacitor (Co). The OUT pin is extremely sensitive and should thus be kept wired away from the LX pin of the MB39C006A as far as possible.
- If applying voltage to the VREFIN pin through dividing resistors, arrange the resistors so that the wiring can be kept as short as possible. Also arrange them so that the GND pin of the VREFIN resistor is close to the IC's GND pin. Further, provide a GND exclusively for the control line so that the resistor can be connected via a path that does not carry current. If installing a bypass capacitor for the VREFIN, put it close to the VREFIN pin.
- Try to make a GND plane on the surface to which the MB39C006A will be mounted. For efficient heat dissipation when using the SON 10 package, FUJITSU MICROELECTRONICS recommends providing a thermal via in the footprint of the thermal pad.

## Layout Example of IC SW components

## MB39C006A

## - Notes for Circuit Design

- The switching operation of the MB39C006A works by monitoring and controlling the peak current which, incidentally, serves as form of short-circuit protection. However, do not leave the output short-circuited for long periods of time. If the output is short-circuited where $\mathrm{VIN}<2.9 \mathrm{~V}$, the current limit value (peak current to the inductor) tends to rise. Leaving in the short-circuit state, the temperature of the MB39C006A will continue rising and activate the thermal protection.
Once the thermal protection stops the output, the temperature of the IC will go down and operation will resume, after which the output will repeat the starting and stopping.
Although this effect will not destroy the IC, the thermal exposure to the IC over prolonged hours may affect the peripherals surrounding it.

## USAGE PRECAUTIONS

## 1. Do not configure the IC over the maximum ratings

If the IC is used over the maximum ratings, the LSI may be permanently damaged.
It is preferable for the device to normally operate within the recommended usage conditions. Usage outside of these conditions can adversely affect reliability of the LSI.
2. Use the devices within recommended operating conditions

The recommended operating conditions are the conditions under which the LSI is guaranteed to operate. The electrical ratings are guaranteed when the device is used within the recommended operating conditions and under the conditions stated for each item.
3. Printed circuit board ground lines should be set up with consideration for common impedance
4. Take appropriate static electricity measures.

- Containers for semiconductor materials should have anti-static protection or be made of conductive material.
- After mounting, printed circuit boards should be stored and shipped in conductive bags or containers.
- Work platforms, tools, and instruments should be properly grounded.
- Working personnel should be grounded with resistance of $250 \mathrm{k} \Omega$ to $1 \mathrm{M} \Omega$ between body and ground.

5. Do not apply negative voltages.

The use of negative voltages below - 0.3 V may create parasitic transistors on LSI lines, which can cause abnormal operation.

## EVALUATION BOARD SPECIFICATION

The MB39C006A Evaluation Board provides the proper environment for evaluating the efficiency and other characteristics of the MB39C006A.

- Terminal information

| Symbol | Functions |
| :---: | :---: |
| VIN | Power supply terminal. <br> In standard condition 3.1 V to $5.5 \mathrm{~V}^{*}$. <br> * When the VIN/VOUT difference is to be held within 0.6 V or less, such as for devices with a standard output voltage (VOUT $=2.5 \mathrm{~V}$ ) and VIN $<3.1 \mathrm{~V}$, FUJITSU MICROELECTRONICS recommends to change the output capacity (C1) to $10 \mu \mathrm{~F}$. |
| VOUT | Output terminal. |
| VCTL | Power supply terminal for setting the CTL terminal. Use this terminal by connecting with VIN (When SW is mounted). |
| CTL | Direct supply terminal of CTL. <br> $\mathrm{CTL}=0 \mathrm{~V}$ to 0.80 V (Typ) : Shutdown <br> CTL $=0.95 \mathrm{~V}$ (Typ) to VIN : Normal operation |
| MODE | Direct supply terminal of MODE. <br> MODE $=0 \mathrm{~V}$ to 0.4 V (Max) : PFM/PWM mode <br> MODE = OPEN (Remove R6) : PWM mode |
| VREF | Reference voltage output terminal. $\mathrm{V}_{\text {REF }}=1.20 \mathrm{~V}$ (Typ) |
| VREFIN | External reference voltage input terminal. When an external reference voltage is supplied, connect to this terminal. |
| FSEL | Operating frequency range setting terminal. <br> FSEL $=0 \mathrm{~V}: 2.0 \mathrm{MHz}$ operation <br> FSEL = VIN : 3.2 MHz operation* <br> * FUJITSU MICROELECTRONICS recommends to change the inductor to $1.5 \mu \mathrm{H}$. |
| POWERGOOD | POWERGOOD output terminal. <br> "High" level output when OUT voltage reaches $97 \%$ or more of output setting voltage. |
| PGND | Ground terminal. Connect power supply GND to the PGND terminal next to the VOUT terminal. |
| AGND | Ground terminal. |

- Startup terminal information

| Terminal name | Condition | Functions |
| :---: | :--- | :--- |
| CTL | L: Open | ON/OFF switch for the IC. |
|  | H : Connect to VIN | L : Shutdown |
|  | H : Normal operation |  |
| FSEL | L : Open | Setting switch of FSEL terminal. |
|  | H : Connect to VIN | L $: 2.0 \mathrm{MHz}$ operation |
|  |  | H:3.2 MHz operation |

- Jumper information

| JP |  |
| :---: | :--- |
| JP1 | Normally used shorted $(0 \Omega)$ |
| JP2 | Not mounted |

## MB39C006A

- Setup and checkup
(1) Setup
(1) -1 . Connect the CTL terminal to the VIN terminal.
(1) -2 . Connect the power supply terminal to the VIN terminal, and the power supply GND terminal to the PGND terminal. (Example of setting power supply voltage : 3.7 V)
(2) Checkup

Supply power to VIN. The IC is operating normally if VOUT $=2.5 \mathrm{~V}$ (Typ).
