

# 4-Mbit (256 K × 16) Static RAM

#### **Features**

■ Very high speed: 45 ns

■ Wide voltage range: 4.5 V to 5.5 V

■ Ultra low standby power

Typical standby current: 1 μA

Maximum standby current: 7 μA

■ Ultra low active power

□ Typical active current: 2 mA at f = 1 MHz

■ Easy memory expansion with CE and OE features

■ Automatic power down when deselected

 Complementary metal oxide semiconductor (CMOS) for optimum speed and power

Available in Pb-free 44-pin thin small outline package (TSOP) Type II package

#### **Functional Description**

The CY62146E is a high performance CMOS static RAM organized as 256K words by 16 bits. This device features advanced circuit design to provide ultra low active current. It is ideal for providing More Battery Life™ (MoBL®) in portable applications. The device also has an automatic power down feature that reduces power consumption when addresses are

not toggling. Placing the device into standby mode reduces power consumption by more than 99% when deselected (CE HIGH). The input and output pins (I/O<sub>0</sub> through I/O<sub>15</sub>) are placed in a high impedance state when the device is deselected (CE HIGH), the outputs are disabled (OE HIGH), both Byte High Enable and Byte Low Enable are disabled (BHE, BLE HIGH) or during a write operation (CE LOW and WE LOW).

To write to the device, take Chip Enable  $\overline{(CE)}$  and Write Enable  $\overline{(WE)}$  inputs LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O<sub>0</sub> through I/O<sub>7</sub>) is written into the location specified on the address pins (A<sub>0</sub> through A<sub>17</sub>). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O<sub>8</sub> through I/O<sub>15</sub>) is written into the location specified on the address pins (A<sub>0</sub> through A<sub>17</sub>).

To read <u>fro</u>m the device, take Chip Enable ( $\overline{\text{CE}}$ ) and Output Enable ( $\overline{\text{OE}}$ ) LOW <u>while</u> forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by <u>the address pins appears on I/O<sub>0</sub> to I/O<sub>7</sub></u>. If Byte High Enable (BHE) is LOW, then data from memory appears on I/O<sub>8</sub> to I/O<sub>15</sub>. See <u>Truth Table on page 11</u> for a complete description of read and write modes.

The CY62146E device is suitable for interfacing with processors that have TTL I/P levels. It is not suitable for processors that require CMOS I/P levels. Please Electrical Characteristics on page 4 for more details and suggested alternatives.

| I <sub>CC</sub>                 | V <sub>CC</sub> operating supply current      | f = 1 MHz   | I <sub>OUT</sub> = 0 mA,<br>CMOS levels       | -          | 2                         | 2.5                   | mA    |
| I <sub>SB2</sub> <sup>[8]</sup> | Automatic CE power down current – CMOS inputs | $\overline{CE} \ge V_{CC} - 0.2 \text{ V}_{IN} \ge V_{CC} - 0.2 \text{ V}_{CC}$<br>f = 0, $V_{CC} = V_{CC}$ | $V$ , $V$ or $V_{IN} \le 0.2 \text{ V}$ , $V$ | _          | 1                         | 7                     | μА    |

- $V_{IL}(min) = -2.0 \text{ V}$  for pulse durations less than 20 ns for I < 30 mA.
- $V_{IH}(max) = V_{CC} + 0.75 \text{ V}$  for pulse durations less than 20 ns.

- V<sub>IH</sub>(Max) = V<sub>CC</sub> + 0.7 s V for pulse durations less than 20 lis.
   Full Device AC operation assumes a minimum of 100 μs ramp time from 0 to V<sub>CC</sub> (min) and 200 μs wait time after V<sub>CC</sub> stabilization.
   Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V<sub>CC</sub> = V<sub>CC(typ)</sub>, T<sub>A</sub> = 25 °C.
   Please note that the maximum V<sub>OH</sub> limit does not exceed minimum CMOS V<sub>IH</sub> of 3.5 V. If you are interfacing this SRAM with 5 V legacy processors that require a minimum V<sub>IH</sub> of 3.5 V, please refer to Application Note AN6081 for technical details and options you may consider.
   Chip enable (CE) and byte enables (BHE and BLE) need to be tied to CMOS levels to meet the I<sub>SB2</sub> / I<sub>CCDR</sub> spec. Other inputs are left floating.

# Capacitance

| Parameter <sup>[9]</sup> | Description        | Test Conditions  | Max | Unit |

 <sup>14.</sup> Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1 V/ns) or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3 V, and output loading of the specified loL/loH as shown in Figure 2 on page 5.
 15. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Notes AN13842 and AN66311. However, the issue has been fixed and in production now, and hence, these Application Notes are no longer applicable. They are available for download on our website as they contain information on the date code of the parts, beyond which the fix has been in

production.

16. At any temperature and voltage condition, t<sub>HZCE</sub> is less than t<sub>LZCE</sub>, t<sub>HZBE</sub> is less than t<sub>LZBE</sub>, t<sub>HZOE</sub> is less than t<sub>LZOE</sub>, and t<sub>HZWE</sub> is less than t<sub>LZWE</sub> for any device.

17. t<sub>HZOE</sub>, t<sub>HZEE</sub>, t<sub>HZBE</sub>, and t<sub>HZWE</sub> transitions are measured when the outputs enter a high-impedance state.

<sup>18.</sup> The internal write time of the memory is defined by the overlap of WE, CE = V<sub>II</sub>, BHE, BLE or both = V<sub>IL</sub>. All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
19. The minimum write cycle pulse width for Write Cycle No. 3 (WE controlled, OE LOW) should be equal to the sum of tsD and thzwe.

# **Switching Waveforms**

Figure 4. Read Cycle No.1: Address Transition Controlled<sup>[20, 21]</sup>

Figure 5. Read Cycle No. 2:  $\overline{\text{OE}}$  Controlled<sup>[21, 22]</sup>

<sup>20.</sup> The device is continuously selected.  $\overline{OE}$ ,  $\overline{CE} = V_{IL}$ ,  $\overline{BHE}$ ,  $\overline{BLE}$ , or both =  $V_{IL}$ . 21.  $\overline{WE}$  is HIGH for read cycle. 22. Address valid before or similar to  $\overline{CE}$ ,  $\overline{BHE}$ ,  $\overline{BLE}$  transition LOW.

## Switching Waveforms (continued)

Figure 6. Write Cycle 1:  $\overline{\text{WE}}$  Controlled [23, 24, 25]

Figure 7. Write Cycle 2:  $\overline{\text{CE}}$  Controlled<sup>[23, 24, 25]</sup>

#### Notes

- 23. Data I/O is high impedance if  $\overline{OE} = V_{IH}$ .
- 24. If  $\overline{\text{CE}}$  goes HIGH simultaneously with  $\overline{\text{WE}}$  =  $V_{\text{IH}}$ , the output remains in a high impedance state.
- 25. The internal write time of the memory is defined by the overlap of WE,  $\overline{\text{CE}} = \text{V}_{\text{IL}}$ ,  $\overline{\text{BHE}}$ ,  $\overline{\text{BLE}}$  or both =  $\text{V}_{\text{IL}}$ . All signals must be active to initiate a write and any of these signals can terminate the write by going inactive. The input setup and hold timing must be referenced to the dge of the signal that terminate the write.

  26. During this period, the I/Os are in output state. Do not apply input signals.

## Switching Waveforms (continued)

Figure 8. Write Cycle 3: WE controlled, OE LOW<sup>[27, 28, 30]</sup>

Figure 9. Write Cycle 4: BHE/BLE Controlled, OE LOW[27, 28]

27. If  $\overline{CE}$  goes HIGH simultaneously with  $\overline{WE} = V_{IH}$ , the output remains in a high impedance state.

<sup>28.</sup> The internal write time of the memory is defined by the overlap of WE,  $\overline{CE} = V_{\parallel L}$ ,  $\overline{BHE}$ ,  $\overline{BLE}$  or both =  $V_{\parallel L}$ . All signals must be active to initiate a write and any of these signals can terminate the write by going inactive. The input setup and hold timing must be referenced to the dge of the signal that terminate the write.

29. During this period, the I/Os are in output state. Do not apply input signals.

30. The minimum write cycle pulse width should be equal to the sum of tsD and thzwe.

# **Truth Table**

| <b>CE</b> [31] | WE | OE | BHE               | BLE               | Inputs/Outputs   | Mode                | Power                      |
