

General Description

MB9EF226 series is based on Cypress's advanced ARM architecture (32-bit with instruction pipeline for RISC-like performance). Improvements compared to the previous generation include significantly improved performance at higher frequency, reduced power consumption and faster start-up time.

For highest processing speed at optimized power consumption an internal PLL can be selected to supply the CPU with up to 128MHz operation frequency from an external resonator.

Note: ARM, Cortex, Thumb and CoreSight are the trademarks of ARM Limited in the EU and other countries.

Features

High-Performance/High Memory Content

- ARM Cortex R4, 8KB D-Cache, 8KB I-Cache
- 32-Bit ARMv7 architecture
- 205 DMIPS
- 2MB Internal Flash
- 48KB Internal EFlash (Data Flash)
- 208KB Internal RAM with ECC

Graphics

- 2D-Graphics Engine
- 1MB Embedded VRAM
- Max Resolution: 1024 pixel hor. x 1024 pixel ver.
- 4 Display Layer plus Alpha blending layer
- Display Controller/TCON
- Max. Pixel clock of 40MHz
- Bit Blitter
- Signature Unit
- Command Sequencer
- TTL and RSDS Output (RGB888)
- Dithering for Display with low color resolution

Connectivity

- 2x CAN, 2 x LIN-USART, 3 x SPI, 1 x I2C, 2 x I2S
- Up to six Stepper Motor Control (SMC) outputs
- HS-SPI (memory mapped access)

Safety Features/Security Features

- Multiple Memory Protection Units (MPU)
- Peripheral Protection Units (PPU)
- Timing Protection Unit (TPU)
- Cyclic Redundancy Checks (CRC of Flash, Cache and RAM)
- Watchdog
- Flash-, Debug- and Test-Security

- Secure Hardware Extension (SHE)
 - Self-contained secure area
 - Random Number generator
 - Secure repository for cryptographic keys
 - AES encryption/decryption block

Other Features

- Up/Down Counters
- Programmable Pulse Generators
- Analog-to-Digital Converters - 50 channels
- Sound Generator
- Free Running/Reload Timers
- Real Time Clock (RTC)
- Input Capture Units, Output Compare units
- 32 external Interrupts

Low Power

- Switchable Power Domains
- 16KB Retention RAM
- Flexible Clock Control
- Debugging/Testing
- ARM Coresight Debug and Trace
- Debugging via JTAG Interface
- Boundary Scan

Characteristics

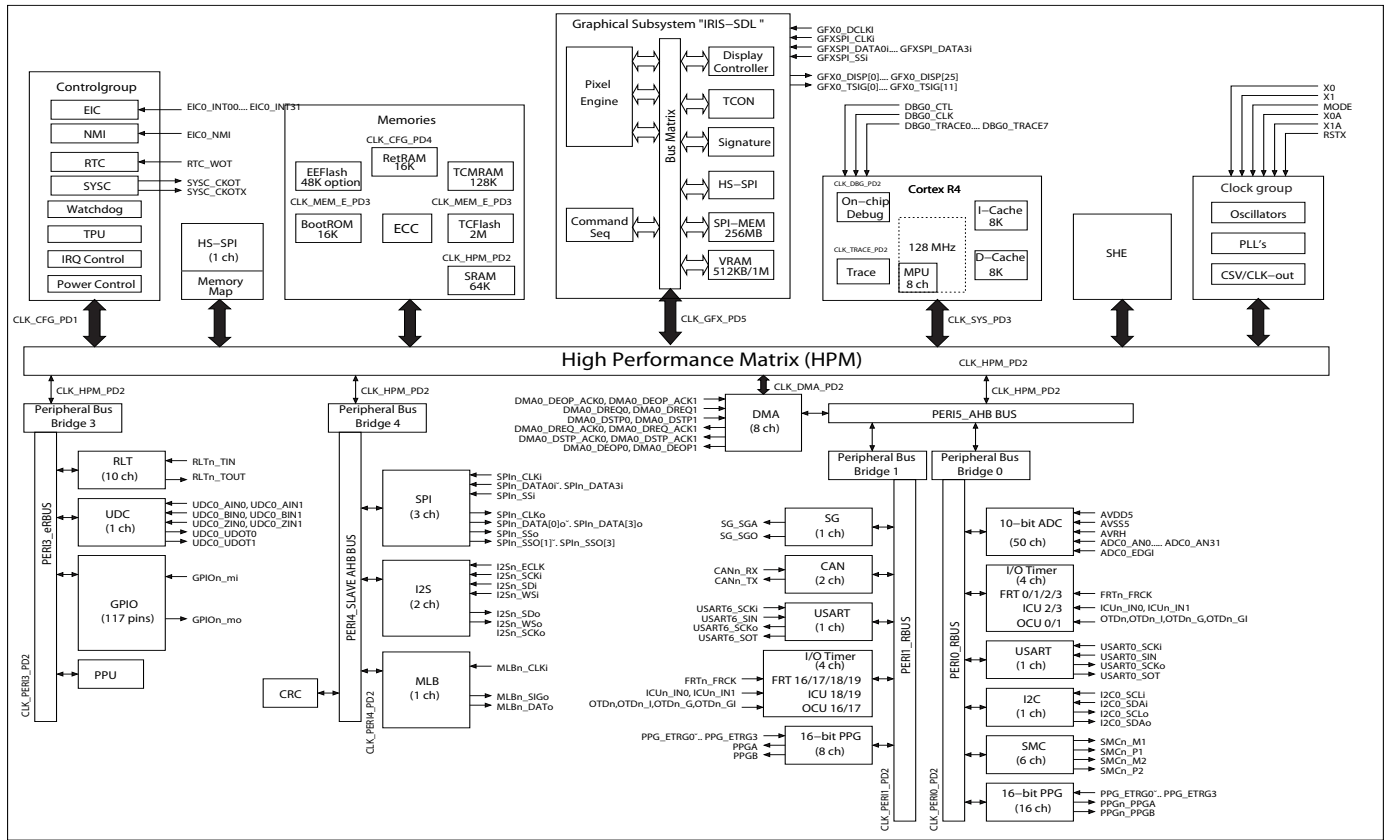

- 5V and 3.3V capable IOs
- Ta: -40 °C to +105 °C
- Package: LQFP-176

Applications

- Hybrid Automotive Instruments Cluster with pointers and TFT display
- Classical Automotive Instruments Cluster with pointers

Errata: For information on silicon errata, see [Errata on page 389](#). Details include trigger conditions, devices affected, and proposed workaround.

Table 2. Device Features

Feature	Description
Technology	90 nm CMOS with embedded flash
Processor Subsystem	<ul style="list-style-type: none"> ■ Cortex R4 CPU core ■ 32-bit ARM architecture, dual-issue superscalar eight stage pipeline ■ ARMv7 and Thumb-2 instruction set compliant ■ Memory Protection Unit (MPU) with 12 regions ■ Two Tightly Coupled Memory (TCM) ports. 64-bit AXI slave port for access to TCMs ■ 64-bit AXI master port ■ Vectored Interrupt Controller (VIC) port for faster interrupt processing ■ Single error correction, double error detection (SECDED) Error Correction Coding (ECC) for memory error detection and correction ■ Instruction cache: 8KB 4-way set-associative ■ Data cache: 8KB 4-way set-associative ■ Up to 8 break-points and 8 watchpoints
Debug and Trace	<ul style="list-style-type: none"> ■ ARM Coresight technology ■ Standard 5-pin JTAG interface ■ 4-bit, 8-bit and 16-bit trace data width supported depending on package ■ Secure entry supported for debugger
Graphics Subsystem	<ul style="list-style-type: none"> ■ 2D graphics engine with base level hardware acceleration ■ Maximum frame resolution: 1024 pixel x 1024 pixel ■ Video modes up to 40MHz pixel clock ■ 1MB embedded SRAM video memory ■ 64-bit multi-layer AXI bus for memory access ■ Quad SPI interface for external flash ■ One background and 3 alpha blended foreground layers. ■ One dedicated alpha layer. ■ Rotation of display by 90/180/270 degrees ■ Gamma correction for display output ■ Color dithering for low resolution panels ■ Copy and blend bit operations (OpenGL and OpenVG blending modes) ■ Pixel formats 1, 2, 4, 8, 16, 24, and 32 bpp ■ Raster operations (ROP2 and ROP3)
Clocks	<ul style="list-style-type: none"> ■ External main clock of 4MHz (up to 8MHz under evaluation) ■ External sub clock (typical 32.768 kHz) ■ Embedded RC oscillator (typical 8/12 MHz, configurable) ■ Embedded Slow RC oscillator (typical 100 kHz) ■ On-chip Phase Locked Loop (PLL) clock multiplier for main clock, Spread Spectrum Clock Generation (SSCG), SSCG for graphics ■ Stabilization timers for all source clocks
Clock Supervisor	<ul style="list-style-type: none"> ■ Clock supervision for all source clocks and PLL outputs ■ Reset generation for out-of-bound clock frequencies on input source clocks, or PLL output clocks

Table 2. Device Features (Continued)

Feature	Description
Resets	<ul style="list-style-type: none"> ■ External Reset ■ Software triggered hard reset ■ Clock supervision resets ■ Watchdog ■ Low Voltage Detection reset ■ Software reset
Watchdog Timer	<ul style="list-style-type: none"> ■ 32-bit counter ■ Supports selection of four clock sources (Main clock, Sub clock, RC clock or Slow RC clock) ■ Support for window watchdog functionality ■ Reset or NMI generation support on watchdog errors ■ Support for preemptive warning interrupt before watchdog reset or NMI generation ■ Additional safety provision through three times redundancy and error correction logic for important configuration bits ■ Option to halt watchdog counter in case of core reaching break-point
DMA	<ul style="list-style-type: none"> ■ 64-bit AHB Master Interface ■ 32-bit AHB Slave Interface ■ Block, burst and demand transfer modes ■ Fixed and incremental addressing for source as well as destination ■ 116 clients ■ 8 channels to handle independent data flows ■ Fixed priority, dynamic priority, and round robin arbitration
Interrupts	<ul style="list-style-type: none"> ■ Interrupt Request (IRQ) and Fast Interrupt Request (FIQ) capability ■ NMI sources can generate FIQ ■ Supports 32 Non Maskable Interrupt (NMI) source for FIQ generation ■ Supports 512 Normal Interrupt sources for IRQ generation ■ Supports request for low power mode entry ■ Programmable 32-level priority controller for normal IRQ sources. Also, supports programmable priority level masking ■ Programmable 16-level priority controller for NMI interrupt sources ■ Software interrupt generation ■ Privileged mode support for restricted access
External Interrupts	<ul style="list-style-type: none"> ■ Up to 32 pins can be used as external interrupts ■ Optional 25ns (typical) noise filters on all lines ■ DMA support ■ NMI support ■ Five polarity support ('H', 'L', rising edge, falling edge, and, any edge) ■ Event capture support for all 32 external interrupt pins ■ Software enabled monitoring of external events, with sampling frequency of 500Hz to 16MHz

Table 2. Device Features (Continued)

Feature	Description
Timing Protection	<ul style="list-style-type: none"> ■ Up to eight identical 24-bit timers for execution time protection, locking time protection, inter-arrival time protection or deadline protection ■ Normal and overflow mode support ■ Global linear prescaler (1 to 64) to scale down clock frequency ■ Additional, individual timer prescaler to support 4 different software programmable frequencies (1, 1/2, 1/4, and 1/16) ■ Start, stop, and continue options per timer controllable by software
Memory Protection	<ul style="list-style-type: none"> ■ Memory protection unit for all bus masters ■ AXI interface support ■ 8 programmable memory regions, and one background region which covers entire 4GB address space ■ Unauthorized access generates NMI
Peripheral Protection	<ul style="list-style-type: none"> ■ Protection to all peripherals and General Purpose IOs (GPIO) ■ Individual protection setting for up to 512 peripherals, and 512 GPIO channels ■ DMA access support for faster register configuration
CAN	<ul style="list-style-type: none"> ■ Supports CAN protocol version 2.0 part A and B ■ Bit rates up to 1 Mbps ■ 64 message objects ■ Each message object has its own identifier mask ■ Programmable FIFO mode (concatenation of message objects) ■ Maskable interrupt ■ Disabled automatic retransmission mode for time triggered CAN applications ■ Programmable loop-back mode for self-test operation
USART/LIN	<ul style="list-style-type: none"> ■ Programmable LIN or USART function ■ Full-duplex support ■ Clock synchronous (start-stop synchronization and start-stop-bit option), and Clock asynchronous (using start-, stop-bits) transfer modes ■ Dedicated baud rate generator. Mechanism for automatic baud rate adjust available in LIN mode ■ Support for data length of 7-bits (not in synchronous or LIN mode) and 8-bits ■ Support for signal modes Non-Return to Zero (NRZ) and Non-Return to Zero Inverted (NRZI) ■ Reception error detection for framing, overrun, parity, checksum, sync field timeout, and frame-ID (only in LIN mode) errors ■ Interrupt capability for transmission, reception, and errors ■ DMA support
I2C	<ul style="list-style-type: none"> ■ Master/slave transmitting and receiving functions ■ 7-bit addressing as master and slave ■ 10-bit addressing as master and slave ■ Acknowledge disable option upon slave address reception (master-only operation) ■ Address mirroring to give interface several slave addresses ■ Up to 400 kbps transfer rate ■ Optional noise filters for SDA and SCL ■ Interrupt capability on transmission and bus error events

Table 2. Device Features (Continued)

Feature	Description
Stepper Motor Control	<ul style="list-style-type: none"> ■ PWM duty cycle programmable from 0% to 100% ■ Programmable setting to select 'L', 'H', 'PWM' and 'HighZ' output ■ High current output pins
A/D Converter	<ul style="list-style-type: none"> ■ 50 channels ■ Conversion time: 1us per channel ■ RC type Successive Approximation (SAR) with sample and hold circuit ■ 10-bit or 8-bit resolution ■ Program selection analog input from 32 channels ■ Single conversion, continuous conversion, and scan conversion options ■ Interrupt capability ■ DMA support ■ 4 range comparator channels for comparing conversion output with thresholds
I2S	<ul style="list-style-type: none"> ■ Programmable master/slave operations ■ Supports transmission only, reception only and simultaneous transmission/reception operations ■ Support for 1 sub frame and 2 sub frame constructions ■ Up to 32 channels supported in each sub frame ■ Support for individual configuration of channel number, channel length, word length in each sub frame ■ Word length support from 7-bits to 32-bits ■ Programmable frequency, polarity, and phase of frame synchronous signal ■ Programmable sampling point of received data (center or at the end of received data) ■ Support for frequency division from 1 to 126 in multiples of 2 ■ DMA support ■ Interrupt capability
Sound Generator	<ul style="list-style-type: none"> ■ Produces sound/melody with varying frequency and amplitude ■ Square wave sound output with frequency of 100Hz – 6kHz (resolution 20Hz) ■ Programmable Pulse Width Modulated (PWM) cycle width of 255 or 511 clocks. PWM duty cycle programmable from 0% to 100% ■ Two 2-bit prescaler with programmable clock division of 1, 1/2, 1/3, and 1/4 ■ Automatic linear or exponential amplitude increment or decrement ■ Start, stop, resume functionality ■ DMA support ■ Automatic sound output stop when amplitude becomes 0
Up Down Counter	<ul style="list-style-type: none"> ■ Format: 32-bit or 2 times 16-bit ■ Three count modes (timer mode, up/down count mode, and phase difference count mode) supported ■ Multiply by 2 or multiply by 4 in phase difference count mode ■ Count source can be internal clock or external trigger ■ Counting range: any value between 0 and $2^{32}-1$ can be set ■ 4 interrupt options (Compare-match interrupt, Underflow interrupt, Overflow interrupt, and Count direction change interrupt)

Table 2. Device Features (Continued)

Feature	Description
Reload Timers	<ul style="list-style-type: none"> ■ 32-bit reload counter ■ External and Internal clock/event source ■ Trigger signal programmable as rising/falling edge or both ■ Gated count function ■ One-shot or reload counter mode ■ Counter state can be made visible at external pin ■ Prescaler with six different settings for the internal clock and two settings for the external clock ■ Several Reload Timers can be cascaded to form a longer Reload Timer ■ DMA support
Free Running Timers	<ul style="list-style-type: none"> ■ Signals an interrupt on overflow, match with Compare registers, zero-detection, or match with Compare Clear Register ■ Option to mask zero detection, compare clear match interrupt, or both to allow for interrupt generation only after multiple events ■ Programmable timer period up to 1 s ■ Support for 11 counter clocks. Prescaler with 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, 1/256, 1/512, and 1/1024 of peripheral clock frequency ■ DMA support
Input Capture Units	<ul style="list-style-type: none"> ■ Consists of 2 independent input channels ■ 16-bit wide capture registers per channel ■ Signals an interrupt upon external event ■ Rising edge, falling edge or rising & falling edge sensitive ■ DMA support
Output Compare Units	<ul style="list-style-type: none"> ■ Consists of 2 independent channels ■ 16-bit wide ■ Signals an interrupt when a match with 16-bit I/O Timer occurs ■ A pair of compare registers can be used to generate an output signal ■ Interrupt capability
Programmable Pulse Generator	<ul style="list-style-type: none"> ■ 16-bit down counter, cycle and duty setting registers ■ Interrupt at trigger, counter borrow and/or duty match ■ PWM operation and one-shot operation ■ Internal prescaler allows 1, 1/4, 1/16, 1/64 of peripheral clock as counter clock and Reload timer underflow as clock input ■ Can be triggered by software or reload timer
Real Time Clock	<ul style="list-style-type: none"> ■ Can be clocked from main clock, sub clock or RC clock ■ Automatic calibration support even when device is in low power state ■ Interrupt capability on half-second, 1 second, 1 minute, 1 hour, and 1 day duration ■ Additional capability for interrupt generation on calibration failure detection and calibration done event ■ Auto calibration of Sub clock or RC clock with respect to Main clock ■ Separate clock selector for calibration ■ Configurable calibration duration ■ Auto/manual trigger for calibration

Table 2. Device Features (Continued)

Feature	Description
Internal Memories- TCMRAM	<ul style="list-style-type: none"> ■ 128 KB ■ 64-bit interface ■ Single error correction, double error detection (SECDED) ECC support
Internal Memories- System RAM	<ul style="list-style-type: none"> ■ 64-bit AXI interface ■ 64 KB ■ Single error correction, double error detection (SECDED) ECC support ■ Parallel read/write capability for 2 different banks
Internal Memories- Retention RAM	<ul style="list-style-type: none"> ■ 16 KB ■ 4 banks ■ 32-bit AHB ■ Low leakage RAMs for low power consumption
Tightly Coupled Flash Memory	<ul style="list-style-type: none"> ■ 2 MB ■ Parallel Programming support ■ Mapped to TCM address space as well as Cacheable address space through AXI interface ■ Single error correction, double error detection (SECDED) ECC support ■ TCM address space supports only read access ■ Cacheable AXI address space supports write and read access ■ Detection of hang-up 1 state ■ 32 large sectors of 64KB each ■ 16 small sectors of 8KB each ■ Sector-wise access protection for write and read accesses
EEPROM Emulation Flash Memory ^[1]	<ul style="list-style-type: none"> ■ 48 KB ■ Single error correction, double error detection (SECDED) ECC support ■ Support for sector erase ■ EEPROM emulation mode support ■ Support for mirroring of memory in 3 diverse memory-mapped regions ■ 6 sectors of 8KB each ■ Sector-wise access protection for write and read accesses <p>Note 1. Electronically Erasable and Programmable Read-Only Memory (EEPROM).</p>
Quad SPI	<ul style="list-style-type: none"> ■ Supports legacy as well as the dual-bit and quad-bit modes of SPI operation ■ Supports up to four slave devices in master mode ■ Programmable transfer rate, active-level of slave-select signal, polarity, and phase of the serial clock per slave select ■ Support for memory mapped operation of external serial flash and serial SRAM devices in command sequencer mode ■ Additional direct mode support for standard SPI operation through FIFO interface
Error Collection	<ul style="list-style-type: none"> ■ Error collection on all peripherals ■ Optional Non-Maskable Interrupt (NMI) generation capability
Low Voltage Detect	<ul style="list-style-type: none"> ■ Low voltage detection for 5V, 3.3V, and 1.2V ■ Programmable thresholds ■ Reset generation capability on low voltage events

Table 2. Device Features (Continued)

Feature	Description
I/O Ports	<ul style="list-style-type: none"> ■ All functional pins can be used as GPIO ■ Programmable analog or digital functionality selection ■ Programmable input levels (Automotive, CMOS, and TTL) ■ Programmable pull-up/pull-down and output drive
MediaLB	<ul style="list-style-type: none"> ■ Implements ■ Supports 16 logical channels ■ Each logical channel can be programmed as synchronous, asynchronous, isochronous and control channel type and as transmit or receive ■ Loop back mode between the logical channel 0 (reception) and logical channel 1 (transmission) ■ Programmable for 256Fs, 512Fs and 1024Fs transfer rates of operation at either 44.0kHz, 48.0kHz, or 48.1kHz. ■ 3-pin mode
SHE	<ul style="list-style-type: none"> ■ Implements all commands defined by the functional specification of SHE (chapter 7) ■ Provides AES-128 encryption and decryption operations ■ Electronic cipher book (ECB) and cipher block chaining (CBC) modes ■ Supports generation of the cipher-based message authentication code (CMAC) ■ Implements Miyaguchi-Preneel compression function. ■ Provides random number generation function ■ Supports secure booting ■ Measurement during / before application start-up ■ Secure boot mode, start address and length of the bootloader are configurable by the user ■ Secure key storage implemented in EEFLASH
CRC	<ul style="list-style-type: none"> ■ Programmable 8, 16, 24 or 32 bit input data width ■ Programmable polynomial value (Polynomial degree from 2 to 32) ■ Programmable initial seed value ■ Programmable final checksum XOR value ■ Interrupt and DMA trigger capability ■ Configurable input/output bit reflection and byte swapping ■ Supports PPU ■ Supports block/multiple data transfers (more than 32-bit)
Packages	<ul style="list-style-type: none"> ■ QFP-240 (evaluation variant with additional trace pins) ■ QFP-176 (series variant)

Resource Distribution for Non-modulated Clock

Some of the resources are available with modulated and non-modulated clock. [Table 12](#) provides the distribution.

Table 12. Clock Modulation for Resources

Module	Non-modulated	Modulation Possible
CAN	2	-
SG	1	-
ICU/OCU/FRT	4	4
PPG	8	16
USART/LIN	1	1
I2C	1	-
SMC	-	6

Lock/Unlock Values for Protection Units

For various protection and system relevant units, registers must be unlocked before configuring and can be locked for protection. For the details about functionality, see the FCR4 Hardware Manual.

Table 13. Lock/Unlock Values for FCR4 Protection Module Instances

Module	Unlock Value	Lock Value
TPU0	ACC5A110	B10CACC5
PPU0	ACC5BB01	BB0B10C1

ID-Values for Module Identification Registers

For several peripheral and system related modules, the hardware contains Module Identification Registers that hold read-only values which contain information about the module number, the version and possible patches.

Table 14. Module ID List

Module	ID-Register	ID Value
System Controller	SYSC_SYSIDR	0x00041100
Security Checker	SCCFG_MODID	0x00020400
SRAM Interface	SRCFG_MID	0x00040300
TC-Flash Interface	TCFCFG_FMIDR	0x000E0400

Package and Pin Assignment

Package

The same die will be used for two packages.

QFP-176 and QFP-240 packages will be used for MB9EF226. The package code is FPT-176P-M07.

Also an optional QFP-240 package with trace pins is shown in [Figure 1](#). The package code is FPT-240P-M06.

I/O Pins and Functions

IO Pin configuration needs to be done by writing into Port Pin Multiplexing registers and Resource Input Configuration registers which are described in [Port Pin Multiplexing](#) and [Resource Input Source](#). GPIO_PPEN register must be enabled before starting IO Pin configuration, since GPIO_PPEN enables corresponding pin of the device.

Note Since writing GPIO PPEN registers are required for both Portmux & resource-mux registers.

Port Pin Multiplexing

176 PIN PLASTIC**

FPT-176P-M07

<p>176-pin plastic LQFP</p>  <p>(FPT-176P-M07)</p>	Lead pitch	0.50 mm
	Package width × package length	24.0 × 24.0 mm
	Lead shape	Gullwing
	Sealing method	Plastic mold
	Mounting height	1.70 mm MAX
	Code (Reference)	P-LQFP-0176-2424-0.50

Interrupt/DMA

This section shows the allocation of interrupt and interrupt vector/interrupt register.

Interrupt Table

Table 28. Interrupt Table

Interrupt Line Number	Interrupt Name	Interrupt Description
0	SYSCIRQ	Status Interrupt from System Controller (SYSC_SYSSTSR:RUNDN is set when current RUN Profile was successfully applied)
1	WDGIRQ	Watchdog pre-warning Interrupt (WDG_INT:IRQ_FLAG is set when watchdog error condition is detected (missing or wrong WDG clearing procedure))
15	MLB0CINT	MLB0 Channel Interrupt (check MLBn_CSCn:[15:0] for detailed Channel interrupt cause)
16	MLB0SINT	MLB0 System Interrupt (check MLB0_SSCn:[7:0] for detailed System interrupt cause)
22	GFXIRQ0	GFX Interrupt 0 (check GFXGCTR_IntStatus0, GFXGCTR_IntStatus1, GFXGCTR_IntMap0, GFXGCTR_IntMap1 for detailed GFX Interrupt 0 cause)
23	GFXIRQ1	GFX Interrupt 1 (check GFXGCTR_IntStatus0, GFXGCTR_IntStatus1, GFXGCTR_IntMap0, GFXGCTR_IntMap1 for detailed GFX Interrupt 1 cause)
30	ADC0IRQ	ADC0 Conversion End Interrupt (ADC0_CS1:INT signals end of conversion for current channel (this flag is mirrored in ADC0_CS3:INT))
31	ADC0IRQ2	ADC0 Scan End Interrupt (ADC0_CS3:INT2 is set when the current scan over selected channels has finished)
32	ADC0IRQR	ADC0 Range Comparator Interrupt (ADC0_RCOINT10~32:RCOINT[15:0] are set when corresponding ADC result is outside selected range (check ADC0_RCOOF10~32:RCOOF[15:0] and the selected mode ADC0_RCOIRS10~32:RCOIRS[15:0] for interrupt cause)
33	ADC0IRQP	ADC0 Pulse Detection Interrupt (ADC0_PCZF10~32:CTPZF[15:0] are set when corresponding pulse counter becomes zero)
34	RRCFGIRQERR	Retention RAM Single Bit Error (RRCFG_CSR:CEIF is set when a correctable error occurred during any read access to Retention RAM)
35	SRCFGIRQERR	System RAM Single Bit Error (SRCFG_ERRFLG:SECFLG is set when a correctable error occurred during any read access to SRAM)
36	TCFCFGIRQ	Instruction Flash Write Completion Interrupt (TCFCFG_FSTATn:RDYINT is set on the rising edge of TCFCFG_FSTATn:RDY flag) Instruction Flash Hang Interrupt (TCFCFG_FSTATn:HANGINT is set when a hang condition occurs in Instruction Flash) Instruction Flash Single Bit Error (TCFCFG_FSECIR:SECINT is set when a correctable error occurred during any read access to Instruction Flash)

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
37	EEFCGIRQERR	Data Flash Error Interrupt (EEFCFG_SR:ERRINT is set if the write command sequencer is disabled in ongoing operation or if any write error occurs during ongoing transfer) Data Flash Hang Interrupt (EEFCFG_SR:HANGINT is set when a hang condition occurs in Data Flash)
38	IRQ0IRQERR	IUNIT Vector RAM Single Bit Error (IRQ0_EEI:EEIS is set when a correctable error occurred during any read access to Interrupt Controller RAM)
41	EEFCGIRQ	Data Flash Write Completion Interrupt (EEFCFG_SR:RDYINT is set on the rising edge of EEFCFG_SR:RDY flag) Data Flash Single Bit Error (EEFCFG_SECIR:SECINT is set when a correctable error occurred during any read access to Data Flash)
42	EICU0IRQ	External Interrupt Capture Unit 0 Interrupt (EICU0_CNFR:DATAVALID is set when 256 samples have been taken at the selected external interrupt input pin)
43	HSSPI0IRQRX	HSSPI0 Receive Interrupt (check HSSPI0_RXF:[6:0] for detailed RX interrupt cause)
44	HSSPI0IRQTX	HSSPI0 Transmit Interrupt (check HSSPI0_TXF:[6:0] for detailed TX interrupt cause)
45	SHE	SHE Error Interrupt (check SHE_IF_CFG_SHE_IRQ[23:16] for detailed SHE Error interrupt cause)
48	SHE	SHE General Interrupt (check SHE_IF_CFG_SHE_IRQ[5:0] for detailed SHE General interrupt cause)
49	SPI0IRQRX	SPI0 Receive Interrupt (check SPI0_RXF:[6:0] for detailed RX interrupt cause)
50	SPI0IRQTX	SPI0 Transmit Interrupt (check SPI0_TXF:[6:0] for detailed TX interrupt cause)
52	SPI1IRQRX	SPI1 Receive Interrupt (check SPI1_RXF:[6:0] for detailed RX interrupt cause)
53	SPI1IRQTX	SPI1 Transmit Interrupt (check SPI1_TXF:[6:0] for detailed TX interrupt cause)
55	SPI2IRQRX	SPI2 Receive Interrupt (check SPI2_RXF:[6:0] for detailed RX interrupt cause)
56	SPI2IRQTX	SPI2 Transmit Interrupt (check SPI2_TXF:[6:0] for detailed TX interrupt cause)
61	CAN0IRQ	CAN0 Interrupt (this interrupt is called depending on CTRLR0:EIE, CTRLR0:SIE and the corresponding transmit/receive interrupt enable flags in the message objects TXE/RXE)
62	CAN1IRQ	CAN1 Interrupt (this interrupt is called depending on CTRLR1:EIE, CTRLR1:SIE and the corresponding transmit/receive interrupt enable flags in the message objects TXE/RXE)
69	EIC0IRQ0	External Interrupt 0 (EIC0_EIRR:ER0 is set when an interrupt condition is detected at the corresponding input pin)

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
70	EIC0IRQ1	External Interrupt 1 (EIC0_EIRR:ER1 is set when an interrupt condition is detected at the corresponding input pin)
71	EIC0IRQ2	External Interrupt 2 (EIC0_EIRR:ER2 is set when an interrupt condition is detected at the corresponding input pin)
72	EIC0IRQ3	External Interrupt 3 (EIC0_EIRR:ER3 is set when an interrupt condition is detected at the corresponding input pin)
73	EIC0IRQ4	External Interrupt 4 (EIC0_EIRR:ER4 is set when an interrupt condition is detected at the corresponding input pin)
74	EIC0IRQ5	External Interrupt 5 (EIC0_EIRR:ER5 is set when an interrupt condition is detected at the corresponding input pin)
75	EIC0IRQ6	External Interrupt 6 (EIC0_EIRR:ER6 is set when an interrupt condition is detected at the corresponding input pin)
76	EIC0IRQ7	External Interrupt 7 (EIC0_EIRR:ER7 is set when an interrupt condition is detected at the corresponding input pin)
77	EIC0IRQ8	External Interrupt 8 (EIC0_EIRR:ER8 is set when an interrupt condition is detected at the corresponding input pin)
78	EIC0IRQ9	External Interrupt 9 (EIC0_EIRR:ER9 is set when an interrupt condition is detected at the corresponding input pin)
79	EIC0IRQ10	External Interrupt 10 (EIC0_EIRR:ER10 is set when an interrupt condition is detected at the corresponding input pin)
80	EIC0IRQ11	External Interrupt 11 (EIC0_EIRR:ER11 is set when an interrupt condition is detected at the corresponding input pin)
81	EIC0IRQ12	External Interrupt 12 (EIC0_EIRR:ER12 is set when an interrupt condition is detected at the corresponding input pin)
82	EIC0IRQ13	External Interrupt 13 (EIC0_EIRR:ER13 is set when an interrupt condition is detected at the corresponding input pin)
83	EIC0IRQ14	External Interrupt 14 (EIC0_EIRR:ER14 is set when an interrupt condition is detected at the corresponding input pin)
84	EIC0IRQ15	External Interrupt 15 (EIC0_EIRR:ER15 is set when an interrupt condition is detected at the corresponding input pin)
85	EIC0IRQ16	External Interrupt 16 (EIC0_EIRR:ER16 is set when an interrupt condition is detected at the corresponding input pin)
86	EIC0IRQ17	External Interrupt 17 (EIC0_EIRR:ER17 is set when an interrupt condition is detected at the corresponding input pin)

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
87	EIC0IRQ18	External Interrupt 18 (EIC0_EIRR:ER18 is set when an interrupt condition is detected at the corresponding input pin)
88	EIC0IRQ19	External Interrupt 19 (EIC0_EIRR:ER19 is set when an interrupt condition is detected at the corresponding input pin)
89	EIC0IRQ20	External Interrupt 20 (EIC0_EIRR:ER20 is set when an interrupt condition is detected at the corresponding input pin)
90	EIC0IRQ21	External Interrupt 21 (EIC0_EIRR:ER21 is set when an interrupt condition is detected at the corresponding input pin)
91	EIC0IRQ22	External Interrupt 22 (EIC0_EIRR:ER22 is set when an interrupt condition is detected at the corresponding input pin)
92	EIC0IRQ23	External Interrupt 23 (EIC0_EIRR:ER23 is set when an interrupt condition is detected at the corresponding input pin)
93	EIC0IRQ24	External Interrupt 24 (EIC0_EIRR:ER24 is set when an interrupt condition is detected at the corresponding input pin)
94	EIC0IRQ25	External Interrupt 25 (EIC0_EIRR:ER25 is set when an interrupt condition is detected at the corresponding input pin)
95	EIC0IRQ26	External Interrupt 26 (EIC0_EIRR:ER26 is set when an interrupt condition is detected at the corresponding input pin)
96	EIC0IRQ27	External Interrupt 27 (EIC0_EIRR:ER27 is set when an interrupt condition is detected at the corresponding input pin)
97	EIC0IRQ28	External Interrupt 28 (EIC0_EIRR:ER28 is set when an interrupt condition is detected at the corresponding input pin)
98	EIC0IRQ29	External Interrupt 29 (EIC0_EIRR:ER29 is set when an interrupt condition is detected at the corresponding input pin)
99	EIC0IRQ30	External Interrupt 30 (EIC0_EIRR:ER30 is set when an interrupt condition is detected at the corresponding input pin)
100	EIC0IRQ31	External Interrupt 31 (EIC0_EIRR:ER31 is set when an interrupt condition is detected at the corresponding input pin)
101	RTCIRQ	Real Time Clock Interrupt (check RTC_WINS:[6:0] for detailed Real Time Clock interrupt cause)
102	SG0IRQ	Sound Generator 0 Interrupt (SG0_CR1:ZAIN (zero amplitude interrupt), SG0_CR1:TCINT (tone pulse count interrupt), SG0_CR1:AMINT (amplitude match interrupt))
104	FRT0IRQ	Free Running Timer 0 Interrupt (FRT0_TCCS:IVF (compare clear match/counter overflow), FRT0_ETCCS:IRQZF (counter zero detection))

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
105	FRT1IRQ	Free Running Timer 1 Interrupt (FRT1_TCCS:IVF (compare clear match/counter overflow), FRT1_ETCCS:IRQZF (counter zero detection))
106	FRT2IRQ	Free Running Timer 2 Interrupt (FRT2_TCCS:IVF (compare clear match/counter overflow), FRT2_ETCCS:IRQZF (counter zero detection))
107	FRT3IRQ	Free Running Timer 3 Interrupt (FRT3_TCCS:IVF (compare clear match/counter overflow), FRT3_ETCCS:IRQZF (counter zero detection))
112	FRT16IRQ	Free Running Timer 16 Interrupt (FRT16_TCCS:IVF (compare clear match/counter overflow), FRT16_ETCCS:IRQZF (counter zero detection))
113	FRT17IRQ	Free Running Timer 17 Interrupt (FRT17_TCCS:IVF (compare clear match/counter overflow), FRT17_ETCCS:IRQZF (counter zero detection))
114	FRT18IRQ	Free Running Timer 18 Interrupt (FRT0_TCCS:IVF (compare clear match/counter overflow), FRT18_ETCCS:IRQZF (counter zero detection))
115	FRT19IRQ	Free Running Timer 19 Interrupt (FRT19_TCCS:IVF (compare clear match/counter overflow), FRT19_ETCCS:IRQZF (counter zero detection))
124	ICU2IRQ0	Input Capture Unit 2 channel 0 Interrupt (ICU2_ICEICS01:IDSE0)
125	ICU2IRQ1	Input Capture Unit 2 channel 1 Interrupt (ICU2_ICEICS01:IDSE1)
126	ICU3IRQ0	Input Capture Unit 3 channel 0 Interrupt (ICU3_ICEICS01:IDSE0)
127	ICU3IRQ1	Input Capture Unit 3 channel 1 Interrupt (ICU3_ICEICS01:IDSE1)
132	ICU18IRQ0	Input Capture Unit 18 channel 0 Interrupt (ICU18_ICEICS01:IDSE0)
133	ICU18IRQ1	Input Capture Unit 18 channel 1 Interrupt (ICU18_ICEICS01:IDSE1)
134	ICU19IRQ0	Input Capture Unit 19 channel 0 Interrupt (ICU19_ICEICS01:IDSE0)
135	ICU19IRQ1	Input Capture Unit 19 channel 1 Interrupt (ICU19_ICEICS01:IDSE1)
136	OCU0IRQ0	Output Compare Unit 1 channel 0 Interrupt (OCU0_OSR01:ICP0)
137	OCU0IRQ1	Output Compare Unit 0 channel 1 Interrupt (OCU0_OSR01:ICP1)
138	OCU1IRQ0	Output Compare Unit 1 channel 0 Interrupt (OCU1_OSR01:ICP0)
139	OCU1IRQ1	Output Compare Unit 1 channel 1 Interrupt (OCU1_OSR01:ICP1)
144	OCU16IRQ0	Output Compare Unit 16 channel 0 Interrupt (OCU16_OSR01:ICP0)
145	OCU16IRQ1	Output Compare Unit 16 channel 1 Interrupt (OCU16_OSR01:ICP1)
146	OCU17IRQ0	Output Compare Unit 17 channel 0 Interrupt (OCU17_OSR01:ICP0)
147	OCU17IRQ1	Output Compare Unit 17 channel 1 Interrupt (OCU17_OSR01:ICP1)
152	USART0IRQRX	LIN USART 0 Receive Interrupt (UART0_SSR:RDF (receive data full), USART0_ESR:RXHRI (automatic reception of LIN header completed))
153	USART0IRQTX	LIN USART 0 Transmit Interrupt (UART0_SSR:TDRE (transmission data empty), USART0_ECCR:RBI = 1 and USART0_ECCR:TBI = 1 and USART0_ECCR:BIE = 1 (bus idle interrupt), USART0_ESR:LBSOF (transmitted last bit in synchronous/asynchronous mode), USART0_ESR:TXHRI (automatic transmission of LIN header completed))

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
154	USART0IRQERR	LIN USART 0 Error Interrupt (USART0_SSR:PE (parity error), USART0_SSR:ORE (overrun error), USART0_SSR:FRE (framing error), USART0_CSCR:CRCERR (error found in checksum validation), USART0_ESR:SYNFE (sync field detection timeout), USART0_ESR:BUSERR (bus error occurred), USART0_ESR:PEFRD (parity error in received frame ID))
158	USART6IRQRX	LIN USART 6 Receive Interrupt (USART6_SSR:RDF (receive data full), USART6_ESR:RXHRI (automatic reception of LIN header completed))
159	USART6IRQTX	LIN USART 6 Transmit Interrupt (USART6_SSR:TDRE (transmission data empty), USART6_ECCR:RBI = 1 and USART6_ECCR:TBI = 1 and USART6_ECCR:BIE = 1 (bus idle interrupt), USART0_ESR:LBSOF (transmitted last bit in synchronous/asynchronous mode), USART0_ESR:TXHRI (automatic transmission of LIN header completed))
160	USART6IRQERR	LIN USART 6 Error Interrupt (USART6_SSR:PE (parity error), USART6_SSR:ORE (overrun error), USART6_SSR:FRE (framing error), USART6_CSCR:CRCERR (error found in checksum validation), USART6_ESR:SYNFE (sync field detection timeout), USART6_ESR:BUSERR (bus error occurred), USART6_ESR:PEFRD (parity error in received frame ID))
164	DMA0IRQD0	DMA0 Completion Interrupt for channels 0 + 8*n (DMACDIRQ1:DIRQ[24, 16, 8, 0] and DMACDIRQ2:DIRQ[56, 48, 40, 32])
165	DMA0IRQD1	DMA0 Completion Interrupt for channels 1 + 8*n (DMACDIRQ1:DIRQ[25, 17, 9, 1] and DMACDIRQ2:DIRQ[57, 49, 41, 33])
166	DMA0IRQD2	DMA0 Completion Interrupt for channels 2 + 8*n (DMACDIRQ1:DIRQ[26, 18, 10, 2] and DMACDIRQ2:DIRQ[58, 50, 42, 34])
167	DMA0IRQD3	DMA0 Completion Interrupt for channels 3 + 8*n (DMACDIRQ1:DIRQ[27, 19, 11, 3] and DMACDIRQ2:DIRQ[59, 51, 43, 35])
168	DMA0IRQD4	DMA0 Completion Interrupt for channels 4 + 8*n (DMACDIRQ1:DIRQ[28, 20, 12, 4] and DMACDIRQ2:DIRQ[60, 52, 44, 36])
169	DMA0IRQD5	DMA0 Completion Interrupt for channels 5 + 8*n (DMACDIRQ1:DIRQ[29, 21, 13, 5] and DMACDIRQ2:DIRQ[61, 53, 45, 37])
170	DMA0IRQD6	DMA0 Completion Interrupt for channels 6 + 8*n (DMACDIRQ1:DIRQ[30, 22, 14, 6] and DMACDIRQ2:DIRQ[62, 54, 46, 38])
171	DMA0IRQD7	DMA0 Completion Interrupt for channels 7 + 8*n (DMACDIRQ1:DIRQ[31, 23, 15, 7] and DMACDIRQ2:DIRQ[63, 55, 47, 39])
172	DMA0IRQERR	DMA0 Error Interrupt (DMACEDIRQ1:EDIRQ[31:0] and DMACEDIRQ2:EDIRQ[63:32])
173	MSCTIRQ	Main Source Clock Timer Interrupt (SYSC_MAINSCTSTATR:INTF is set when counter matches or is greater than the corresponding compare register)
174	SSCTIRQ	Sub Source Clock Timer Interrupt (SYSC_SUBSCTSTATR:INTF is set when counter matches or is greater than the corresponding compare register)
175	RCSCTIRQ	RC Source Clock Timer Interrupt (SYSC_RCSCTSTATR:INTF is set when counter matches or is greater than the corresponding compare register)
176	SRCSCTIRQ	Slow RC Source Clock Timer Interrupt (SYSC_SRCSCTSTATR:INTF is set when counter matches or is greater than the corresponding compare register)
177	CORE0IRQ	CORTEX R4 Performance Monitor Interrupt

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
178	RLT0IRQ	Reload Timer 0 Interrupt (RLT0_TMCSR:UF is set when reload timer counter underflows)
179	RLT1IRQ	Reload Timer 1 Interrupt (RLT1_TMCSR:UF is set when reload timer counter underflows)
180	RLT2IRQ	Reload Timer 2 Interrupt (RLT2_TMCSR:UF is set when reload timer counter underflows)
181	RLT3IRQ	Reload Timer 3 Interrupt (RLT3_TMCSR:UF is set when reload timer counter underflows)
182	RLT4IRQ	Reload Timer 4 Interrupt (RLT4_TMCSR:UF is set when reload timer counter underflows)
183	RLT5IRQ	Reload Timer 5 Interrupt (RLT5_TMCSR:UF is set when reload timer counter underflows)
184	RLT6IRQ	Reload Timer 6 Interrupt (RLT6_TMCSR:UF is set when reload timer counter underflows)
185	RLT7IRQ	Reload Timer 7 Interrupt (RLT7_TMCSR:UF is set when reload timer counter underflows)
186	RLT8IRQ	Reload Timer 8 Interrupt (RLT8_TMCSR:UF is set when reload timer counter underflows)
187	RLT9IRQ	Reload Timer 9 Interrupt (RLT9_TMCSR:UF is set when reload timer counter underflows)
194	UDC0IRQ0	Up/Down Counter 0 channel 0 Interrupt (UDN0_CS0:OVFF (overflow), UDFE (underflow), CMPF (compare match))
195	UDC0IRQ1	Up/Down Counter 0 channel 1 Interrupt (UDN0_CS1:OVFF (overflow), UDFE (underflow), CMPF (compare match))
198	I2S0IRQ	I2S0 Interrupt (check I2S0_STATUS:[31:24], [19], [17:16] for detailed interrupt cause)
199	I2S1IRQ	I2S1 Interrupt (check I2S1_STATUS:[31:24], [19], [17:16] for detailed interrupt cause)
202	I2C0IRQ	I2C0 Interrupt (I2C0_IBCSR_INT (masked by I2C0_IBCSR_INTE) set after end of 1 byte data transfer or reception including acknowledge bit (bus master, addressed as slave, GCA received, Arbitration lost), I2C0_IBCSR_BER (masked by I2C0_IBCSR_BEIE) indicates bus error (Start- or Stop-Condition detected at wrong places))
203	I2C0IRQERR	I2C0 Error Interrupt (I2C0_IBCSR_BER (masked by I2C0_IEIER_BEREIE) indicates bus error (Start- or Stop-Condition detected at wrong places), I2C0_IBCSR_AL (masked by I2C0_IEIER_ALEIE) indicates arbitration lost)
206	CRC0IRQ	CRC0 Interrupt (CRC0_CFG:CIRQ set after checksum is calculated and available in register)
208	PPG0IRQ	Programmable Pulse Generator 0 Interrupt (PPG0_PCN:IRQF set depending on PPG0_PCN:IRS[2:0], PPG0_EPCN1:TRIG set when PWM output generation is started, PPG0_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388). Programmable Pulse Generator 0 Interrupt

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
209	PPG1IRQ	Programmable Pulse Generator 1 Interrupt (PPG1_PCN:IRQF set depending on PPG1_PCN:IRS[2:0], PPG1_EPCN1:TRIG set when PWM output generation is started, PPG1_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
210	PPG2IRQ	Programmable Pulse Generator 2 Interrupt (PPG2_PCN:IRQF set depending on PPG2_PCN:IRS[2:0], PPG2_EPCN1:TRIG set when PWM output generation is started, PPG2_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
211	PPG3IRQ	Programmable Pulse Generator 3 Interrupt (PPG3_PCN:IRQF set depending on PPG3_PCN:IRS[2:0], PPG3_EPCN1:TRIG set when PWM output generation is started, PPG3_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
212	PPG4IRQ	Programmable Pulse Generator 4 Interrupt (PPG4_PCN:IRQF set depending on PPG4_PCN:IRS[2:0], PPG4_EPCN1:TRIG set when PWM output generation is started, PPG4_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
213	PPG5IRQ	Programmable Pulse Generator 5 Interrupt (PPG5_PCN:IRQF set depending on PPG5_PCN:IRS[2:0], PPG5_EPCN1:TRIG set when PWM output generation is started, PPG5_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
214	PPG6IRQ	Programmable Pulse Generator 6 Interrupt (PPG6_PCN:IRQF set depending on PPG6_PCN:IRS[2:0], PPG6_EPCN1:TRIG set when PWM output generation is started, PPG6_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
215	PPG7IRQ	Programmable Pulse Generator 7 Interrupt (PPG7_PCN:IRQF set depending on PPG7_PCN:IRS[2:0], PPG7_EPCN1:TRIG set when PWM output generation is started, PPG7_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
216	PPG8IRQ	Programmable Pulse Generator 8 Interrupt (PPG8_PCN:IRQF set depending on PPG8_PCN:IRS[2:0], PPG8_EPCN1:TRIG set when PWM output generation is started, PPG8_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
217	PPG9IRQ	Programmable Pulse Generator 9 Interrupt (PPG9_PCN:IRQF set depending on PPG9_PCN:IRS[2:0], PPG9_EPCN1:TRIG set when PWM output generation is started, PPG9_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
218	PPG10IRQ	Programmable Pulse Generator 10 Interrupt (PPG10_PCN:IRQF set depending on PPG10_PCN:IRS[2:0], PPG10_EPCN1:TRIG set when PWM output generation is started, PPG10_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
219	PPG11IRQ	Programmable Pulse Generator 11 Interrupt (PPG11_PCN:IRQF set depending on PPG11_PCN:IRS[2:0], PPG11_EPCN1:TRIG set when PWM output generation is started, PPG11_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
220	PPG12IRQ	Programmable Pulse Generator 12 Interrupt (PPG12_PCN:IRQF set depending on PPG12_PCN:IRS[2:0], PPG12_EPCN1:TRIG set when PWM output generation is started, PPG12_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
221	PPG13IRQ	Programmable Pulse Generator 13 Interrupt (PPG13_PCN:IRQF set depending on PPG13_PCN:IRS[2:0], PPG13_EPCN1:TRIG set when PWM output generation is started, PPG13_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
222	PPG14IRQ	Programmable Pulse Generator 14 Interrupt (PPG14_PCN:IRQF set depending on PPG14_PCN:IRS[2:0], PPG14_EPCN1:TRIG set when PWM output generation is started, PPG14_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
223	PPG15IRQ	Programmable Pulse Generator 15 Interrupt (PPG15_PCN:IRQF set depending on PPG15_PCN:IRS[2:0], PPG15_EPCN1:TRIG set when PWM output generation is started, PPG15_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
232	PPG64IRQ	Programmable Pulse Generator 64 Interrupt (PPG64_PCN:IRQF set depending on PPG64_PCN:IRS[2:0], PPG64_EPCN1:TRIG set when PWM output generation is started, PPG64_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
233	PPG65IRQ	Programmable Pulse Generator 65 Interrupt (PPG65_PCN:IRQF set depending on PPG65_PCN:IRS[2:0], PPG65_EPCN1:TRIG set when PWM output generation is started, PPG65_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
234	PPG66IRQ	Programmable Pulse Generator 66 Interrupt (PPG66_PCN:IRQF set depending on PPG66_PCN:IRS[2:0], PPG66_EPCN1:TRIG set when PWM output generation is started, PPG66_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
235	PPG67IRQ	Programmable Pulse Generator 67 Interrupt (PPG67_PCN:IRQF set depending on PPG67_PCN:IRS[2:0], PPG67_EPCN1:TRIG set when PWM output generation is started, PPG67_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
236	PPG68IRQ	Programmable Pulse Generator 68 Interrupt (PPG68_PCN:IRQF set depending on PPG68_PCN:IRS[2:0], PPG68_EPCN1:TRIG set when PWM output generation is started, PPG68_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).

Table 28. Interrupt Table (Continued)

Interrupt Line Number	Interrupt Name	Interrupt Description
237	PPG69IRQ	Programmable Pulse Generator 69 Interrupt (PPG69_PCN:IRQF set depending on PPG69_PCN:IRS[2:0], PPG69_EPCN1:TRIG set when PWM output generation is started, PPG69_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
238	PPG70IRQ	Programmable Pulse Generator 70 Interrupt (PPG70_PCN:IRQF set depending on PPG70_PCN:IRS[2:0], PPG70_EPCN1:TRIG set when PWM output generation is started, PPG70_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).
239	PPG71IRQ	Programmable Pulse Generator 71 Interrupt (PPG71_PCN:IRQF set depending on PPG71_PCN:IRS[2:0], PPG71_EPCN1:TRIG set when PWM output generation is started, PPG71_EPCN2:[7:0]). See detailed description in FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388).

NMI

Table 29. NMI List

NMI Number	Source	Description
0	EIC0NMI	External Pin NMI (EIC0_NMIR:NMIINT)
1	SYSCNMILVD	Low Voltage Detect NMI (check SYSC_SYSERRR:LVD12IF, SYSC_SYSERRR:LVD33IF, SYSC_SYSERRR:LVD50IF for detailed NMI cause)
2	SYSCNMIERR	System Controller Error NMI (check SYSC_SYSERRR:RUNERRIF, SYSC_SYSERRR:RUNWKERRIF, SYSC_SYSERRR:PSSERRIF, SYSC_SYSERRR:TRGERRIF, SYSC_SYSERRR:RUNTRGEIF, SYSC_SYSERRR:MOMISSIF, SYSC_SYSERRR:SOMISSIF, SYSC_SYSERRR:MPMISSIF, SYSC_SYSERRR:SPMISSIF, SYSC_SYSERRR:GPMISSIF, SYSC_SYSERRR:PSSENEIF for detailed NMI cause)
3	WDGNMI	Watchdog NMI (WDG_INT:NMI_FLAG is set on Watchdog error condition if WDG_INT:NMI_EN is '1')
4	TPU0NMI	Timing Protection Unit NMI (check TPU0TIR:IR[7:0] bits for detailed NMI cause) Note The Timing Protection Unit NMI is maskable within the TPU but non-maskable on system level.
5	MPUXDMA0NMI	MPU DMA0 Access Violation NMI (MPUXDMA0_CTRL0:NMI is set when a memory protection violation by DMA0 is detected)
7	MPUXGFXNMI	MPU IRIS-SDL Access Violation NMI(MPUXGFX_CTRL0:NMI is set when a memory protection violation by IRIS-SDL is detected)
8	MPUHMLB0NMI	MPU MLB0 Access Violation NMI(MPUHMLB0_CTRL0:NMI is set when a memory protection violation by MLB0 is detected)
9	IRQ0NMIERR	IRQ Double Error NMI (IRQ0_EEI:EENS bit is set when a double bit error is detected in the IRQ0 Interrupt Vector RAM)
11	BECU0NMI	BECU0 Access Violation NMI (BECU0_CTRL:NMI bit is set when a bus error is detected on the Peripheral Group 0 bus)
12	BECU1NMI	BECU1 Access Violation NMI (BECU1_CTRL:NMI bit is set when a bus error is detected on the Peripheral Group 1 bus)
13	BECU3NMI	BECU3 Access Violation NMI (BECU3_CTRL:NMI bit is set when a bus error is detected on the Peripheral Group 3 bus)
14	GFXNMI	GFX Signature Unit NMI (GFXGCTR_NmiStatus:NmiStatus is set if the number of error frames has exceeded the threshold value)
18	MPUSHE	MPU SHE Access Violation NMI(MPUXSHE0_CTRL0:NMI is set when a memory protection violation by SHE is detected)

DMA Overview
Table 30. Modules with DMA

DMA Request Number	DMA Request Name	DMA Request Description
0	EXTDMA0	External DMA Request 0 (external pin DMA0_DREQ0)
1	EXTDMA1	External DMA Request 1 (external pin DMA0_DREQ0)
8	EIC0DMA0	External Interrupt 0 DMA Request (EIC0_DRFR:DRF0)
9	EIC0DMA1	External Interrupt 1 DMA Request (EIC0_DRFR:DRF1)
10	EIC0DMA2	External Interrupt 2 DMA Request (EIC0_DRFR:DRF2)
11	EIC0DMA3	External Interrupt 3 DMA Request (EIC0_DRFR:DRF3)
12	EIC0DMA4	External Interrupt 4 DMA Request (EIC0_DRFR:DRF4)
13	EIC0DMA5	External Interrupt 5 DMA Request (EIC0_DRFR:DRF5)
14	EIC0DMA6	External Interrupt 6 DMA Request (EIC0_DRFR:DRF6)
15	EIC0DMA7	External Interrupt 7 DMA Request (EIC0_DRFR:DRF7)
16	EIC0DMA8	External Interrupt 8 DMA Request (EIC0_DRFR:DRF8)
17	EIC0DMA9	External Interrupt 9 DMA Request (EIC0_DRFR:DRF9)
18	EIC0DMA10	External Interrupt 10 DMA Request (EIC0_DRFR:DRF10)
19	EIC0DMA11	External Interrupt 11 DMA Request (EIC0_DRFR:DRF11)
20	EIC0DMA12	External Interrupt 12 DMA Request (EIC0_DRFR:DRF12)
21	EIC0DMA13	External Interrupt 13 DMA Request (EIC0_DRFR:DRF13)
22	EIC0DMA14	External Interrupt 14 DMA Request (EIC0_DRFR:DRF14)
23	EIC0DMA15	External Interrupt 15 DMA Request (EIC0_DRFR:DRF15)
24	EIC0DMA16	External Interrupt 16 DMA Request (EIC0_DRFR:DRF16)
25	EIC0DMA17	External Interrupt 17 DMA Request (EIC0_DRFR:DRF17)
26	EIC0DMA18	External Interrupt 18 DMA Request (EIC0_DRFR:DRF18)
27	EIC0DMA19	External Interrupt 19 DMA Request (EIC0_DRFR:DRF19)
28	EIC0DMA20	External Interrupt 20 DMA Request (EIC0_DRFR:DRF20)
29	EIC0DMA21	External Interrupt 21 DMA Request (EIC0_DRFR:DRF21)
30	EIC0DMA22	External Interrupt 22 DMA Request (EIC0_DRFR:DRF22)
31	EIC0DMA23	External Interrupt 23 DMA Request (EIC0_DRFR:DRF23)

146	OCU1DMA0	Output Compare Unit 1 channel 0 DMA Request (OCU1_OSR01:ICP0*)
147	OCU1DMA1	Output Compare Unit 1 channel 1 DMA Request (OCU1_OSR01:ICP1*)
176	OCU16DMA0	Output Compare Unit 16 channel 0 DMA Request (OCU16_OSR01:ICP0*)
177	OCU16DMA1	Output Compare Unit 16 channel 1 DMA Request (OCU16_OSR01:ICP1*)
178	OCU17DMA0	Output Compare Unit 17 channel 0 DMA Request (OCU17_OSR01:ICP0*)
179	OCU17DMA1	Output Compare Unit 17 channel 1 DMA Request (OCU17_OSR01:ICP1*)

Table 30. Modules with DMA (Continued)

DMA Request Number	DMA Request Name	DMA Request Description
208	USART0DMARX	LIN USART 0 Receive DMA Request (USART0_SSR:RDRF* (RX data full flag))
209	USART0DMATX	LIN USART 0 Transmit DMA Request (USART0_SSR:TDRE* (TX data empty flag))
220	USART6DMARX	LIN USART 6 Receive DMA Request (USART6_SSR:RDRF* (RX data full flag))
221	USART6DMATX	LIN USART 6 Transmit DMA Request (USART6_SSR:TDRE* (TX data empty flag))
232	I2C0DMARX	I2C0 Receive DMA Request (I2C0_IBCSR:INT*)
233	I2C0DMATX	I2C0 Transmit DMA Request (I2C0_IBCSR:INT*)
244	PPG0DMA	Programmable Pulse Generator 0 DMA Request (PPG0_PCN:IRQF*)
245	PPG1DMA	Programmable Pulse Generator 1 DMA Request (PPG1_PCN:IRQF*)
246	PPG2DMA	Programmable Pulse Generator 2 DMA Request (PPG2_PCN:IRQF*)
247	PPG3DMA	Programmable Pulse Generator 3 DMA Request (PPG3_PCN:IRQF*)
248	PPG4DMA	Programmable Pulse Generator 4 DMA Request (PPG4_PCN:IRQF*)
249	PPG5DMA	Programmable Pulse Generator 5 DMA Request (PPG5_PCN:IRQF*)
250	PPG6DMA	Programmable Pulse Generator 6 DMA Request (PPG6_PCN:IRQF*)
251	PPG7DMA	Programmable Pulse Generator 7 DMA Request (PPG7_PCN:IRQF*)
252	PPG8DMA	Programmable Pulse Generator 8 DMA Request (PPG8_PCN:IRQF*)
253	PPG9DMA	Programmable Pulse Generator 9 DMA Request (PPG9_PCN:IRQF*)
254	PPG10DMA	Programmable Pulse Generator 10 DMA Request (PPG10_PCN:IRQF*)
255	PPG11DMA	Programmable Pulse Generator 11 DMA Request (PPG11_PCN:IRQF*)
256	PPG12DMA	Programmable Pulse Generator 12 DMA Request (PPG12_PCN:IRQF*)
257	PPG13DMA	Programmable Pulse Generator 13 DMA Request (PPG13_PCN:IRQF*)
258	PPG14DMA	Programmable Pulse Generator 14 DMA Request (PPG14_PCN:IRQF*)
259	PPG15DMA	Programmable Pulse Generator 15 DMA Request (PPG15_PCN:IRQF*)
308	PPG64DMA	Programmable Pulse Generator 64 DMA Request (PPG64_PCN:IRQF*)
309	PPG65DMA	Programmable Pulse Generator 65 DMA Request (PPG65_PCN:IRQF*)
310	PPG66DMA	Programmable Pulse Generator 66 DMA Request (PPG66_PCN:IRQF*)
311	PPG67DMA	Programmable Pulse Generator 67 DMA Request (PPG67_PCN:IRQF*)
312	PPG68DMA	Programmable Pulse Generator 68 DMA Request (PPG68_PCN:IRQF*)
313	PPG69DMA	Programmable Pulse Generator 69 DMA Request (PPG69_PCN:IRQF*)
314	PPG70DMA	Programmable Pulse Generator 70 DMA Request (PPG70_PCN:IRQF*)
315	PPG71DMA	Programmable Pulse Generator 71 DMA Request (PPG71_PCN:IRQF*)
372	ADC0DMA	ADC0 Conversion End DMA Request (ADC0_CS1:INT* (end of conversion flag))
373	ADC0DMA2	ADC0 Scan End DMA Request (ADC0_CS3:INT2* (end of scan flag))
376	RLT0DMA	Reload Timer 0 DMA Request (RTL0_TMCSR:UF* (underflow flag))
377	RLT1DMA	Reload Timer 1 DMA Request (RTL1_TMCSR:UF* (underflow flag))

Table 30. Modules with DMA (Continued)

DMA Request Number	DMA Request Name	DMA Request Description
378	RLT2DMA	Reload Timer 2 DMA Request (RTL2_TMCSR:UF* (underflow flag))
379	RLT3DMA	Reload Timer 3 DMA Request (RTL3_TMCSR:UF* (underflow flag))
380	RLT4DMA	Reload Timer 4 DMA Request (RTL4_TMCSR:UF* (underflow flag))
381	RLT5DMA	Reload Timer 5 DMA Request (RTL5_TMCSR:UF* (underflow flag))
382	RLT6DMA	Reload Timer 6 DMA Request (RTL6_TMCSR:UF* (underflow flag))
383	RLT7DMA	Reload Timer 7 DMA Request (RTL7_TMCSR:UF* (underflow flag))
384	RLT8DMA	Reload Timer 8 DMA Request (RTL8_TMCSR:UF* (underflow flag))
385	RLT9DMA	Reload Timer 9 DMA Request (RTL9_TMCSR:UF* (underflow flag))
408	I2S0DMARX	I2S0 Receive DMA Request (I2S0_STATUS:RXFI* (receive FIFO full))
409	I2S0DMATX	I2S0 Transmit DMA Request (I2S0_STATUS:TXFI* (transmit FIFO empty))
410	I2S1DMARX	I2S0 Receive DMA Request (I2S1_STATUS:RXFI* (receive FIFO full))
411	I2S1DMATX	I2S0 Transmit DMA Request (I2S1_STATUS:TXFI* (transmit FIFO empty))
424	CRC0DMA	CRC0 DMA Request (CRC0_CFG:CIRQ* (CRC calculated flag))
426	SPI0DMARX	SPI0 Receive DMA Request (SPI0_RXF:RFMTS* (RX FIFO fill level more than threshold))
427	SPI0DMATX	SPI0 Transmit DMA Request (SPI0_TXF:TFLETS* (TX FIFO fill level less or equal to threshold))
428	SPI1DMARX	SPI1 Receive DMA Request (SPI1_RXF:RFMTS* (RX FIFO fill level more than threshold))
429	SPI1DMATX	SPI1 Transmit DMA Request (SPI1_TXF:TFLETS* (TX FIFO fill level less or equal to threshold))
430	SPI2DMARX	SPI2 Receive DMA Request (SPI2_RXF:RFMTS* (RX FIFO fill level more than threshold))
431	SPI2DMATX	SPI2 Transmit DMA Request (SPI2_TXF:TFLETS* (TX FIFO fill level less or equal to threshold))
450	EEFLASHDMA	EE Flash DMA Request (EEFCFG_WSR:ST[1:0])
467	PPUDMA	PPU DMA Request (DMA is triggered by successful PPU UNLOCK (PPU0_UNLOCK) indicated by PPU0_ST:LST = 0)

PPU

Table 31. List of PPU Channels

Note
 3. In general, a PPU channel controls the access in user mode to the corresponding peripheral. However, there are a few exceptions:

- PPCPRIV controls the access to PPC in privileged mode.
- PPCUSER controls the access to PPC in user mode.
- MSCT, SSCT, RCSC1 and SRCSC1 control the access to the source clock timers within the System Controller, i.e. the registers SYSC_MSCT*, SYSC_SSCT*, SYSC_RCSC1* and SYSC_SRCSC1, after the corresponding source clock stabilization time has elapsed
- WDG controls the write access in user mode to the Watchdog trigger registers, so WDG has no read attribute
- Read attribute for DBG0 is always enabled. Even privilege mode access for DBG0 needs PPU to be enabled.

Master ID

Table 32. List of Master IDs used on MB9EF226 Device

Master Name	Master ID (USER Signal Values)
CPU_S0	0x04
DMA_SI	0x08
DAP_AHB	0x01
TIC_AHB	0x00
MLB0_AHB	0x02
SUBSYS (IRIS-SDL)	0x0C
SHE	0x10

Notes

4. SYSC_SPCCFGR:FASTON register bit is reserved and should be always written as '0', since this device does not support "Fast Power domain control" feature.
5. SCCFG_STAT1:EEFCEEN and SCCFG_STAT1:TCFCEEN register bits are read-1 (write has no impact and read always returns '1') in this device.
6. SCCFG_STAT1:FPPEN and SCCFG_STAT1:SCMEN register bits are read-0 (write has no impact and read always returns '0') in this device.

Electrical Characteristics

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

Table 44. Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage	V_{DP5}	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	
	V_{DP3}	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	
	V_{DD}	$V_{SS} - 0.3$	$V_{SS} + 1.8$	V	
	AV_{DD5}	$AV_{SS5} - 0.3$	$AV_{SS5} + 6.0$	V	$V_{DP5} = AV_{DD5}$ ^[7]
AD Converter voltage references	AV_{RH5}	$AV_{SS5} - 0.3$	$AV_{SS5} + 6.0$	V	$AV_{DD5} \geq AV_{RH5} \geq AV_{SS5}$
SMC Power supply	DV_{CC}	$DV_{SS} - 0.3$	$DV_{SS} + 6.0$	V	See Note [9], $V_{DP5} = AV_{DD5} = DV_{CC}$ when ZPD functionality is used
Analog input voltage	V_{IA}	$AV_{SS5} - 0.3$	$AV_{DD5} + 0.3$	V	
Input voltage	V_I	$V_{SS} - 0.3$	$V_{DP5} + 0.3$	V	$V_I \leq DV_{CC}, V_{DP5} + 0.3V$ ^[8]
		$V_{SS} - 0.3$	$V_{DP3} + 0.3$	V	
		$DV_{SS} - 0.3$	$DV_{CC} + 0.3$	V	
Output voltage	V_O	$V_{SS} - 0.3$	$V_{DP5} + 0.3$	V	$V_O \leq DV_{CC}, V_{DP5} + 0.3V$ ^[8]
		$V_{SS} - 0.3$	$V_{DP3} + 0.3$	V	
		$DV_{SS} - 0.3$	$DV_{CC} + 0.3$	V	
Maximum Clamp Current	I_{CLAMP}	-4	+4	mA	Applicable to general purpose I/O pins ^[9]
Total Maximum Clamp Current	$\sum I_{CLAMP} $	-	20	mA	Applicable to general purpose I/O pins ^[9]
"L" level maximum output current	I_{OL1}	-	2	mA	Normal outputs (BIDI50) with driving strength set to 1mA
	I_{OL2}	-	4	mA	Normal outputs (BIDI50) with driving strength set to 2mA
	I_{OL5}	-	10	mA	Normal outputs (BIDI50) with driving strength set to 5mA
	I_{OLI2C}	-	6	mA	I2C outputs (I2C) with driving strength set to 3mA
	I_{OLHSIO}	-	24	mA	High Speed outputs (BIDI33) with driving strength set to 12mA
	I_{OLSMC}	-	40	mA	SMC outputs (SMC) with driving strength set to 30mA
	I_{OLTTL2}	-	4	mA	TTL outputs (TTL33, RSDS) with driving strength set to 2mA
	I_{OLTTL5}	-	10	mA	TTL outputs (TTL33, RSDS) with driving strength set to 5mA
	$I_{OLTTL10}$	-	20	mA	TTL outputs (TTL33, RSDS) with driving strength set to 10mA
	$I_{OLTTL20}$	-	40	mA	TTL outputs (TTL33, RSDS) with driving strength set to 20mA

	$\Sigma I_{OHAVDP3}$	-	-50	mA	-
	$\Sigma I_{OHADVCC}$	-	-230	mA	-
Differential maximum output current	$I_{ODHRSDS0}$	-	4	mA	RSDS outputs (RSDS) with RSDS BOOST = 0
	$I_{ODHRSDS1}$	-	8	mA	RSDS outputs (RSDS) with RSDS BOOST = 1
Differential maximum output current overall output current	$\Sigma I_{ODHVDP3}$	-	100	mA	-
Differential average output current	$I_{ODAVRSDS0}$		2	mA	RSDS outputs (RSDS) with RSDS BOOST = 0
	$I_{ODAVRSDS1}$		4	mA	RSDS outputs (RSDS) with RSDS BOOST = 1
Differential average output current overall output current	$\Sigma I_{ODAVVDP3}$		50	mA	-
Power consumption	P_{TOT}	-	2000	mW	-
Operating ambient temperature	T_A	-40	105	°C	-
Storage temperature	T_{STG}	-55	150	°C	-

Notes

7. AV_{DD5} and V_{DP5} must be set to the same voltage. It is required that AV_{DD5} does not exceed V_{DP5} and that the voltage at the analog inputs does not exceed AV_{DD5} neither when the power is switched on.
8. V_I and V_O should not exceed $V_{DP5} + 0.3$ V. V_I should also not exceed the specified ratings. However if the maximum current to/from an input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating. Input/output voltages of standard ports depend on V_{DP5} .
9. Clamping current limitation:
 - Applicable to all general purpose I/O pins (PI_{jj})
 - Use within recommended operating conditions.
 - Use at DC voltage (current)
 - The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
 - The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
 - Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V_{DP5} pin, and this may affect other devices.
 - Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V), the power supply is provided from the pins, so that incomplete operation may result.
 - Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the Power reset (except devices with persistent low voltage reset in internal vector mode).
10. Sample recommended circuits is shown in [Figure 5](#).

Figure 5. ESD Protection Structure for GPIO Pins

11. DV_{CC} , AV_{DD5} and V_{DP5} must be set to the same voltage during zero point detection (ZPD) on any of the SMC ports. If zero point detection is not required on any of the SMC ports, then DV_{CC} can have any value with-in absolute rating, provided switches are disabled by $RICFG0_ADC0ZPDEN:ZPDEN$ register. Note, for ZPD, conversion time will be more and accuracy of measurement will be low.

Recommended Operating Conditions
Table 45. Recommended Operating Conditions

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
5V power supply voltage	V _{DP5}	3.0	3.3/5.0	5.5	V	
3.3V power supply voltage	V _{DP3}	3.0	3.3	3.6	V	
1.2V power supply voltage	V _{DD}	1.1	1.2	1.3	V	
SMC power supply voltage	DV _{CC}	4.5	5.0	5.5	V	If used as SMC
	DV _{CC}	3.0	3.3/5.0	5.5	V	If used as GPIO
Analog power supply voltage	AV _{DD5}	3.0	3.3/5.0	5.5	V	
AD Converter voltage reference	AV _{RH5}	AV _{DD5} - 0.5	-	AV _{DD5}	V	
Operation ambient temperature	T _{OP}	-40	-	105	°C	

Warning: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the devices electrical characteristics are guaranteed when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operating outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

DC Characteristics

($T_A = -40^{\circ}\text{C}$ to 105°C , $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

Power consumption	P _{OP}	-	-	1250	mW	-		

AC Characteristics

Source Clock Timing

(TA = -40 °C to 105 °C, VDD = 1.1V to 1.3V, VDP3 = 3.0V to 3.6V, VDP5 = AVDD5 = 3.0V to 5.5V, DVCC = 3.0V to 5.5V, VSS = AVSS5 = DVSS = 0V)

Table 47. Source Clock Timing

Parameter	Symbol	Pin	Value			Unit	Remarks
			Min	Typ	Max		
Oscillator Clock Frequency	f_c	X0,X1	3	4	5	MHz	When using a crystal oscillator, PLL off
			–	4	–	MHz	When using an opposite phase external clock, PLL off
			–	4	–	MHz	When using a crystal oscillator or opposite phase external clock, PLL on. PLL input clock divider (PLLDIVL) must be greater than 1 since PLL does not support input clock freq more than 16MHz
Oscillator Clock Frequency	f_{FCI}	X0	0	–	62.5	MHz	When using a single phase external clock in “Fast Clock Input mode”, PLL off
			4	–	62.5	MHz	When using a single phase external clock in Fast Clock Input mode, PLL on PLL input clock divider (PLLDIVL) must be greater than 1 since PLL does not support input clock freq more than 16MHz
Oscillator Clock Frequency	f_{CL}	X0A, X1A	32	32.768	100	kHz	When using an oscillation circuit
			0	–	100	kHz	When using a opposite phase external clock
		X0A	0	–	50	kHz	When using a single phase external clock
Slow Clock Frequency	f_{CRS}	–	50	100	150	kHz	When using slow frequency of RC oscillator
Fast RCO Clock Frequency	f_{CRF}	–	6.3	7.9	10.1	MHz	When using fast frequency of RC oscillator (8MHz mode) and SYSC_RCCFGR:TRM[7:0] = 0x7F
			9.3	11.6	14.6	MHz	When using fast frequency of RC oscillator (12MHz mode) and SYSC_RCCFGR:TRM[7:0] = 0x7F
Fast RCO Clock Stability	f_{PRCF}	–	-2	–	+2	%	T _A = 0..70 °C
			-6	–	+6	%	T _A = -40..105 °C
PLL Clock Frequency	f_{CLKVCO}	–	200	–	400	MHz	Permitted VCO output frequency of PLL (CLKVCO) Please also see limitation for f_{PLLVCO} input frequency
PLL Input Frequency (after DIVL)	f_{PLLVCO}	–	4	–	16	MHz	Input frequency of PLL after PLLDIVL divider. PLL input clock divider (PLLDIVL) must be greater than 1, if the frequency at the Clock input exceeds 16MHz
PLL Phase Jitter	T _{PSKEW}	–	-5	–	±5	ns	For CLKMC (PLL input clock) - 4 MHz, jitter coming from external oscillator, crystal or resonator is not yet recovered
Input Clock Pulse Width	P _{WH} , P _{WL}	X0, X1	8	–	–	ns	Duty ratio is about 30% to 70%
Input Clock Pulse Width	P _{WHL} , P _{WLL}	X0A, X1A	5	–	–	ns	–

Figure 6. Source Clock Timing

Internal Clock Timing

(TA = -40 °C to 105 °C, VDD = 1.1V to 1.3V, VDP3 = 3.0V to 3.6V, VDP5 = AVDD5 = 3.0V to 5.5V, DVCC = 3.0V to 5.5V, VSS = AVSS5 = DVSS = 0V)

Table 48. Internal Clock Timing

Parameter	Symbol	Min	Max	Unit	Remarks
CLK_SYS_PD3	fCLK_SYS_PD3	0	128	MHz	—
CLK_DBG_PD2	fCLK_DBG_PD2	0	128	MHz	—
CLK_DBG_PD3	fCLK_DBG_PD3	0	128	MHz	—
CLK_TRACE_PD2	fCLK_TRACE_PD2	0	128	MHz	—
CLK_TRACE_PD3	fCLK_TRACE_PD3	0	128	MHz	—
CLK_HPM_PD2	fCLK_HPM_PD2	0	128	MHz	—
CLK_HPM_PD3	fCLK_HPM_PD3	0	128	MHz	—
CLK_CFG_PD4	fCLK_CFG_PD4	0	64	MHz	—
CLK_DMA_PD2	fCLK_DMA_PD2	0	128	MHz	—
CLK_MEM_I_PD3	fCLK_MEM_I_PD3	0	128	MHz	—
CLK_MEM_E_PD3	fCLK_MEM_E_PD3	0	128	MHz	—
CLK_CFG_PD1	fCLK_CFG_PD1	0	64	MHz	—
CLK_PERI4_PD2	fCLK_PERI4_PD2 ^[12]	0	128	MHz	—
CLK_GFX_PD5	fCLK_GFX_PD5		128	MHz	—
CLK_PERI0_PD2	fCLK_PERI0_PD2	0	64	MHz	—
CLK_PERI1_PD2	fCLK_PERI1_PD2	0	32	MHz	—
CLK_PERI3_PD2	fCLK_PERI3_PD2	0	64	MHz	—
CLK_SPI_PD5	fCLK_SPI_PD5		128	MHz	—
CLK_PIX_PD5	fCLK_PIX_PD5		400	MHz	—
CLK_SPI_PD3	fCLK_SPI_PD3	0	128	MHz	—
CKOT, CKOTX	fCKOT, fCKOTX	0	128	MHz	internal clock, set clock divider >4 for output

Note

12. If MediaLB is used, a minimum CLK_PERI4_PD2 value of 50 MHz is required. In addition, the system must be able to handle 6MByte/sec on the bus. This means that depending on the bus traffic, as well as access to system RAM by other masters, higher CLK_PERI4_PD2 values are required.

External Reset Timing

($T_A = -40\text{ }^\circ\text{C}$ to $105\text{ }^\circ\text{C}$, $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

Table 49. External Reset Timing

Parameter	Symbol	Pin	Value			Unit	Remarks
			Min	Typ	Max		
Reset input time	t_{RSTL}	RSTX	500	—	—	ns	—

Figure 7. External Reset Timing

External Input Timing

($T_A = -40\text{ }^\circ\text{C}$ to $105\text{ }^\circ\text{C}$, $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

Table 50. External Input Timing

Parameter	Symbol	Pin	Condition	Value		Unit	Used Pin Input Function
				Min	Max		
Input pulse width	t_{INH} t_{INL}	EIC0_INTk	-	200	-	ns	External Interrupt
		NMI					NMI
		Pi_jj		$2 * t_{CLK_PER} + t_{NF}^{[13, 14]}$	-	ns	General purpose IO
		RLTn_TIN					Reload Timer
		PPG_ETRGx					PPG Trigger input
		ADCn_EDGI					AD Converter Trigger
		FRTn_FRCK					Free Running Timer external clock
		ICUn_INm					Input Capture
		UDCn_AIN, UDCn_BIN, UDCn_ZIN					Up/Down Counter

Notes

- 13. t_{CLK_PER} is the period of the corresponding peripheral clock.
- 14. t_{NF} is 200ns, if noise filter is enabled and 0ns, if noise filter is bypassed.

Figure 8. External Input Timing

Slew Rate High Current Outputs

($T_A = -40\text{ }^{\circ}\text{C}$ to $105\text{ }^{\circ}\text{C}$, $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

Table 51. Slew Rate High Current Outputs

Parameter	Symbol	Pin	Condition	Value		Unit	Remarks
				Min	Max		
Output rise/fall time	t_{R30} t_{F30}	I/O circuit type SMC	Output driving strength set to "30mA"	15 at $C_{LOAD} = 0\text{ pF}$	—	ns	—

Figure 9. Slew Rate High Current Output Timing

USART Timing

Note The values given below are for an I/O drive strength IOdrive = 5mA. If IOdrive is 2mA, all the maximum output timing described in the different tables must be increased by 10ns.

($T_A = -40\text{ }^\circ\text{C}$ to $105\text{ }^\circ\text{C}$, $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = 0\text{V}$, $I_{Odrive} = 5\text{ mA}$, $C_L = 50\text{ pF}$)

Table 52. USART Timing

Parameter	Symbol	Pin	Condition	$V_{DP5} = 4.5\text{V to } 5.5\text{V}$		$V_{DP5} = 3.0\text{V to } 4.5\text{V}$		Unit
				Min	Max	Min	Max	
Serial clock cycle time	t_{SCYCI}	SCK	Internal Shift Clock Mode	$4 * t_{CLK_PERIO_PD2}$	-	$4 * t_{CLK_PERIO_PD2}$	-	ns
SCK SOT delay time	t_{SLOVI}	SCK, SOT		-20	+20	-30	+30	ns
SOT SCK delay time	t_{OVSHI}	SCK, SOT		$N * t_{CLK_PERIO_PD2} - 20^{[18]}$	-	$N * t_{CLK_PERIO_PD2} - 30^{[18]}$	-	ns
Valid SIN SCK	t_{IVSHI}	SCK, SIN		$t_{CLK_PERIO_PD2} + 45$	-	$t_{CLK_PERIO_PD2} + 55$	-	ns
SCK Valid SIN hold time	t_{SHIXI}	SCK, SIN		0	-	0	-	ns
Serial clock "L" pulse width	t_{SLBHE}	SCK	External Shift Clock Mode	$t_{CLK_PERIO_PD2} + 10$	-	$t_{CLK_PERIO_PD2} + 10$	-	ns
Serial clock "H" pulse width	t_{SHSLE}	SCK		$t_{CLK_PERIO_PD2} + 10$	-	$t_{CLK_PERIO_PD2} + 10$	-	ns
SCK SOT delay time	t_{SLOVE}	SCK, SOT		-	$2 * t_{CLK_PERIO_PD2} + 45$	-	$t_{CLK_PERIO_PD2} + 45$	ns
Valid SIN SCK	t_{IVSHE}	SCK, SIN		$t_{CLK_PERIO_PD2} / 2 + 10$	-	$t_{CLK_PERIO_PD2} / 2 + 10$	-	ns
SCK Valid SIN hold time	t_{SHIXE}	SCK, SIN		$t_{CLK_PERIO_PD2} + 10$	-	$t_{CLK_PERIO_PD2} + 10$	-	ns
SCK fall time	t_{FE}	SCK		-	20	-	20	ns
SCK rise time	t_{RE}	SCK		-	20	-	20	ns

Notes

- 15. AC characteristic in CLK synchronized mode.
- 16. CL is the load capacity value of pins when testing.
- 17. Depending on the used machine clock frequency, the maximum possible baud rate can be limited by some parameters.
 $t_{CLK_PERIO_PD2}$ is the cycle time of the clock (CLK_PERIO_PD2), Unit: ns
- 18. Parameter N depends on t_{SCYCI} and can be calculated as follows:
 - if $t_{SCYCI} = 2 * k * t_{CLK_PERIO_PD2}$, then $N = k$, where k is an integer > 2
 - if $t_{SCYCI} = (2 * k + 1) * t_{CLK_PERIO_PD2}$, then $N = k + 1$, where k is an integer > 1.

Examples

t_{SCYCI}	N
$4 * t_{CLK_PERIO_PD2}$	2
$5 * t_{CLK_PERIO_PD2}$, $6 * t_{CLK_PERIO_PD2}$	3
$7 * t_{CLK_PERIO_PD2}$, $8 * t_{CLK_PERIO_PD2}$	4
....

Figure 10. USART Timing

I²C Timing

(T_A = -40 °C to 105 °C, V_{DD} = 1.1V to 1.3V, V_{DP3} = 3.0V to 3.6V, V_{DP5} = AV_{DD5} = 4.5V to 5.5V^[18], DV_{CC} = 3.0V to 5.5V, V_{SS} = AV_{SS5} = DV_{SS} = 0V)

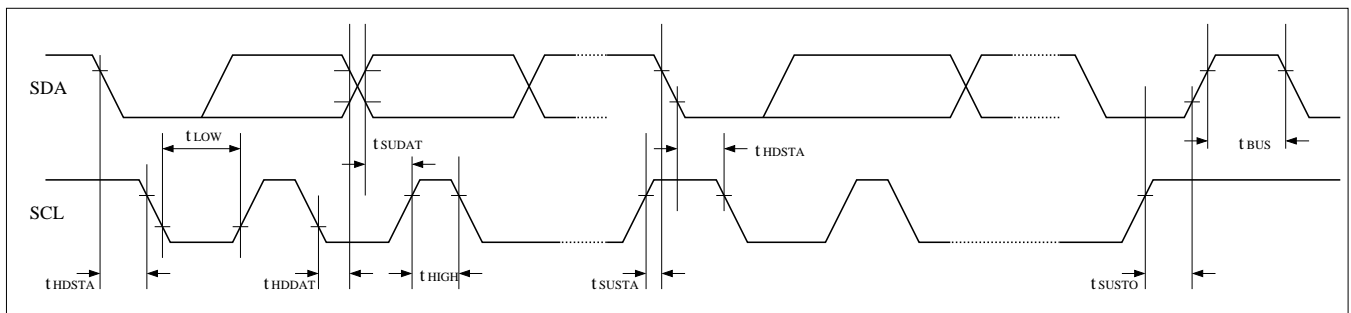

Table 53. I²C Timing

Parameter	Symbol	Standard-Mode		Fast-Mode		Unit
		Min	Max	Min	Max	
SCL clock frequency	f _{SCL}	0	100	0	400	kHz
Hold time (repeated) START condition SDA↓→SCL↓	t _{HDSTA}	4.0	-	0.6	-	μs
“L” width of the SCL clock	t _{LOW}	4.7	-	1.3	-	μs
“H” width of the SCL clock	t _{HIGH}	4.0	-	0.6	-	μs
Set-up time for a repeated START condition SCL↑→SDA↓	t _{SUSTA}	4.7	-	0.6	-	μs
Data hold time SCL↓→SDA↑	t _{HDDAT}	0	3.45	0	0.9	μs
Data set-up time SDA---↓→SCL↑ -	t _{SUDAT}	250	-	100	-	ns
Set-up time for STOP condition SCL--↑→SDA-↑	t _{SUSTO}	4	-	0.6	-	μs
Bus free time between a STOP and START condition	t _{BUS}	4.7	-	1.3	-	μs
Output fall time from 0.7*V _{DP5} to 0.3*V _{DP5} with a bus capacitance from 10pF to 400pF	t _{of}	20 + 0.1*C _b ^[20]	250	20 + 0.1*C _b ^[20]	250	ns
Capacitive load for each bus line	C _b	-	400	-	400	pF
Pulse width of spikes which will be suppressed by input noise filter	t _{SP}	n/a	n/a	0	1*t _{CLK_PERIO_PD2} ^[21]	ns

Notes

- 19. For use at over 100 kHz, set the CLK_PERIO_PD2 to at least 6 MHz.
- 20. C_b = capacitance of one bus line in pF.
- 21. t_{CLK_PERIO_PD2} is the cycle time of the peripheral clock CLK_PERIO_PD2
- 22. I²C spec only guaranteed at VDP5 = 4.5V to 5.5V.

Figure 11. I²C Timing

HSSPI Timing

($T_A = -40\text{ }^{\circ}\text{C}$ to $105\text{ }^{\circ}\text{C}$, $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

Table 54. HSSPI Interface Timing (Master Mode)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
HSSPI clock frequency		-	-	64	MHz	
Input setup time (HSSPIn_DATAi)	$T_{IS,DATA}$	12.1	-	-	ns	no clock retiming
		5.6	-	-	ns	with clock retiming
Input hold time (HSSPIn_DATAi)	$T_{IH,DATA}$	0	-	-	ns	no clock retiming
		1.5	-	-	ns	with clock retiming
Output delay time (HSSPIn_DATAo)	$T_{OD,DATA}$	-	-	3.8	ns	
Output hold time (HSSPIn_DATAo)	$T_{OH,DATA}$	5	-	-	ns	
Output delay time (HSSPIn_SSELo)	$T_{OD,SSEL}$	-	-	5.05	ns	
Output hold time (HSSPIn_SSELo)	$T_{OH,SSEL}$	0	-	-	ns	

Figure 12. HSSPI Interface Timing

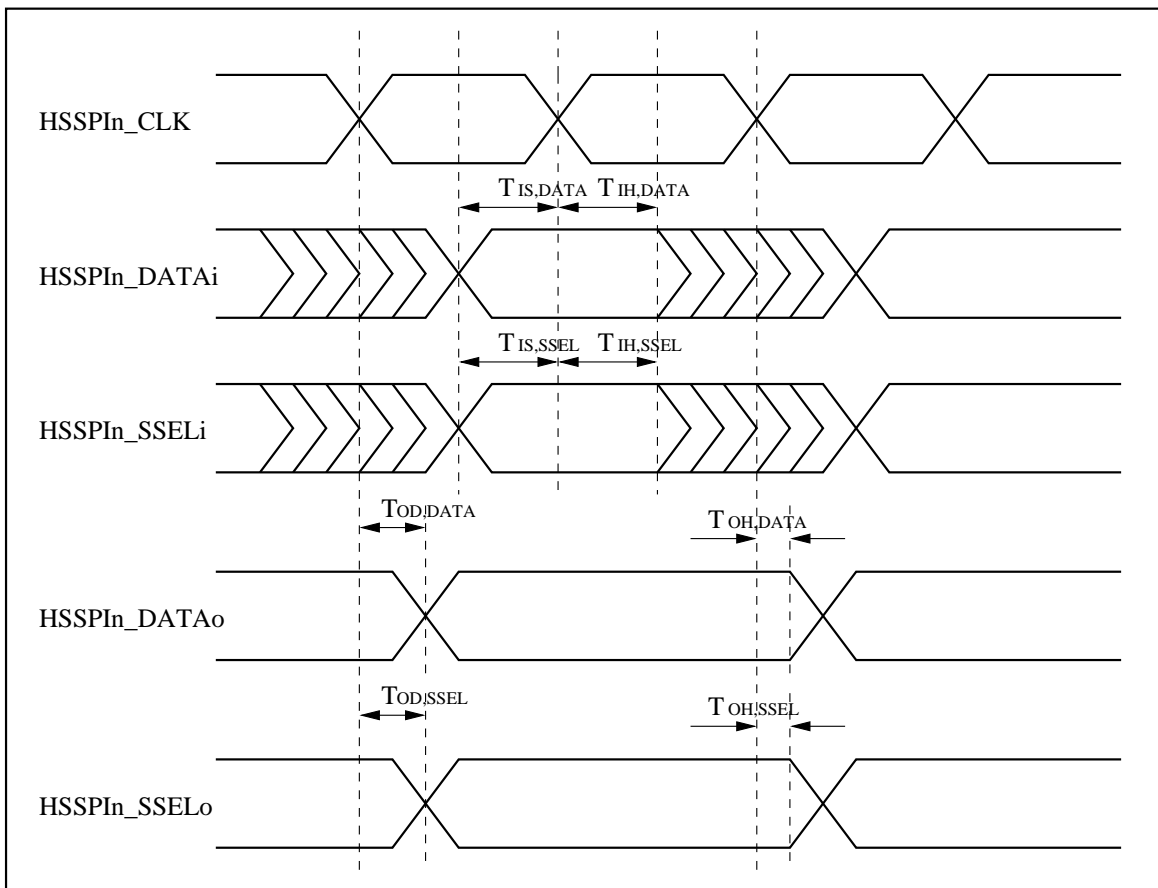

Table 55. HSSPI Interface Timing (Slave Mode)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
HSSPI clock frequency		-	-	25	MHz	
Input setup time (HSSPIIn_DATAi)	$T_{IS,DATA}$	5	-	-	ns	
Input hold time (HSSPIIn_DATAi)	$T_{IH,DATA}$	0	-	-	ns	
Input setup time (HSSPIIn_SSELi)	$T_{IS,SSEL}$	8.2	-	-	ns	
Input hold time (HSSPIIn_SSELi)	$T_{IH,SSEL}$	2	-	-	ns	
Output delay time (HSSPIIn_DATAo)	$T_{OD,DATA}$	-	-	15.5	ns	
Output hold time (HSSPIIn_SSELo)	$T_{OH,DATA}$	0	-	-	ns	

SPI Timing

($T_A = -40\text{ }^{\circ}\text{C}$ to $105\text{ }^{\circ}\text{C}$, $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V ,

$V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

For each SPI module, several combinations of I/O pins can be chosen for each SPI signal. The timing depends on the actual combination and is given below as separate values for each possible type of I/O-cell. When I/O/cells of different types are mixed, the worst case table, called “OVERALL SPI Interface timing” must be used.

In Master Mode, using the clock retiming function improves the setup and hold times for input data.

The usable maximum clock frequency depends on the transmission mode (Master to Slave / Slave to Master, using clock-retiming or not). An example for calculation is given below each table.

Table 56. OVERALL SPI Interface Timing

Parameter	Symbol	Master Mode, Non-retimed Clock		Master Mode, Retimed Clock		Slave Mode		Unit
		Min	Max	Min	Max	Min	Max	
Input setup time (SPIn_DATAi)	$T_{IS,DATA}$	24.9	-	9.9	-	9.8	-	ns
Input hold time (SPIn_DATAi)	$T_{IH,DATA}$	-6.1 ^[23]	-	9.9	-	9.8	-	ns
Output delay time (SPIn_DATAo)	$T_{OD,DATA}$	-	12.2	-	12.2	-	41.5	ns
Output hold time (SPIn_DATAo)	$T_{OH,DATA}$	-5.3 ^[23]	-	-5.3 ^[23]	-	6.3	-	ns
Input setup time (SPIn_SSELi)	$T_{IS,SSEL}$	-	-	-	-	11.9	-	ns
Input hold time (SPIn_SSELi)	$T_{IH,SSEL}$	-	-	-	-	7.9	-	ns
Output delay time (SPIn_SSELo)	$T_{OD,SSEL}$	-	12.1	-	12.1	-	-	ns
Output hold time (SPIn_SSELo)	$T_{OH,SSEL}$	-4.6 ^[23]	-	-4.6 ^[23]	-	-	-	ns
Example for calculation of max. frequencies for communication of Master (retimed mode) and Slave:								
Transmission		Half Period Time				Max. Frequency		Unit
From Master to Slave		$T/2 = T_{OD,DATA}$ (Master) + $T_{IS,DATA}$ (Slave)				20.8		MHz
From Slave to Master		$T/2 = T_{OD,DATA}$ (Slave) + $T_{IS,DATA}$ (Master)				10.5		MHz

Note

23. A negative hold time implies that the clock edge output is delayed with respect to data output. In any case, an external device that will receive data, must use a sampling point that is outside the time interval given by Output hold time and Output delay time.

Table 57. SPI Interface Timing for All Cells of Type RSDS

Parameter	Symbol	Master Mode, non-retimed clock		Master Mode, retimed clock		Slave Mode		Unit
		Min	Max	Min	Max	Min	Max	
Input setup time (SPIn_DATAi)	T _{IS,DATA}	23.8	-	3.1	-	3.0	-	ns
Input hold time (SPIn_DATAi)	T _{IH,DATA}	-7.0 ^[24]	-	8.4	-	8.3	-	ns
Output delay time (SPIn_DATAo)	T _{OD,DATA}	-	11.6	-	11.6	-	41.5	ns
Output hold time (SPIn_DATAo)	T _{OH,DATA}	-4.1 ^[24]	-	-4.1 ^[24]	-	7.6	-	ns
Input setup time (SPIn_SSELi)	T _{IS,SSEL}	-	-	-	-	7.8	-	ns
Input hold time (SPIn_SSELi)	T _{IH,SSEL}	-	-	-	-	3.8	-	ns
Output delay time (SPIn_SSELo)	T _{OD,SSEL}	-	11.5	-	11.5	-	-	ns
Output hold time (SPIn_SSELo)	T _{OH,SSEL}	2.6	-	2.6	-	-	-	ns
Example for calculation of max. frequencies for communication of Master (retimed mode) and Slave:								
Transmission		Half Period Time				Max. Frequency		Unit
From Master to Slave		T/2 = T _{OD,DATA} (Master) + T _{IS,DATA} (Slave)				25.9		MHz
From Slave to Master		T/2 = T _{OD,DATA} (Slave) + T _{IS,DATA} (Master)				11.2		MHz

Note

24. A negative hold time implies that the clock edge output is delayed with respect to data output. In any case, an external device that will receive data, must use a sampling point that is outside the time interval given by Output hold time and Output delay time.

Table 58. SPI Interface Timing for All Cells of Type BIDI50

Parameter	Symbol	Master Mode, non-retimed clock		Master Mode, retimed clock		Slave Mode		Unit
		Min	Max	Min	Max	Min	Max	
Input setup time (SPIn_DATAi)	T _{IS,DATA}	24.4	-	5.5	-	5.2	-	ns
Input hold time (SPIn_DATAi)	T _{IH,DATA}	-6.1 ^[25]	-	5.4	-	5.3	-	ns
Output delay time (SPIn_DATAo)	T _{OD,DATA}	-	9.2	-	9.2	-	30.2	ns
Output hold time (SPIn_DATAo)	T _{OH,DATA}	-4.7 ^[25]	-	-4.7 ^[25]	-	6.4	-	ns
Input setup time (SPIn_SSELi)	T _{IS,SSEL}	-	-	-	-	8.3	-	ns

Note

25. A negative hold time implies that the clock edge output is delayed with respect to data output. In any case, an external device that will receive data, must use a sampling point that is outside the time interval given by Output hold time and Output delay time.

Table 58. SPI Interface Timing for All Cells of Type BDI50

Parameter	Symbol	Master Mode, non-retimed clock		Master Mode, retimed clock		Slave Mode		Unit
		Min	Max	Min	Max	Min	Max	
Input hold time (SPIn_SSELi)	$T_{IH,SSEL}$	-	-	-	-	2.2	-	ns
Output delay time (SPIn_SSELo)	$T_{OD,SSEL}$	-	7.4	-	7.4	-	-	ns
Output hold time (SPIn_SSELo)	$T_{OH,SSEL}$	0.3	-	0.3	-	-	-	ns
Example for calculation of max. frequencies for communication of Master (retimed mode) and Slave:								
Transmission		Half Period Time				Max. Frequency		Unit
From Master to Slave		$T/2 = T_{OD,DATA} \text{ (Master)} + T_{IS,DATA} \text{ (Slave)}$				31.8		MHz
From Slave to Master		$T/2 = T_{OD,DATA} \text{ (Slave)} + T_{IS,DATA} \text{ (Master)}$				14.0		MHz

Note

25. A negative hold time implies that the clock edge output is delayed with respect to data output. In any case, an external device that will receive data, must use a sampling point that is outside the time interval given by Output hold time and Output delay time.

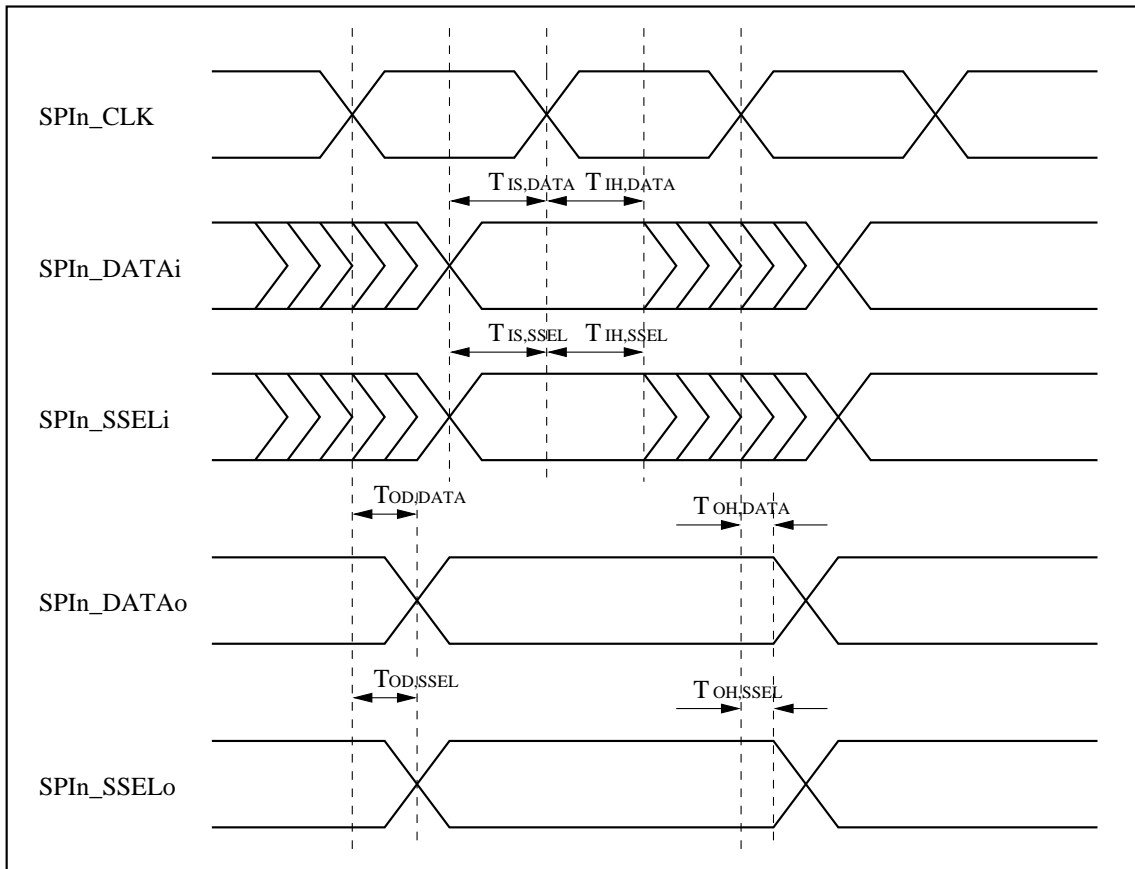

Table 59. SPI Interface Timing for All Cells of Type SMC

Parameter	Symbol	Master Mode, non-retimed clock		Master Mode, retimed clock		Slave Mode		Unit
		Min	Max	Min	Max	Min	Max	
Input setup time (SPIn_DATAi)	$T_{IS,DATA}$	24.9	-	4.4	-	4.3	-	ns
Input hold time (SPIn_DATAi)	$T_{IH,DATA}$	-6.8 ^[26]	-	5.3	-	5.2	-	ns

Analog Digital Converter

($T_A = -40\text{ }^\circ\text{C}$ to $105\text{ }^\circ\text{C}$, $3.0\text{V} \leq AV_{RH5}$, $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

Table 60. Analog Digital Converter

Parameter	Symbol	Pin	Value			Unit	Remarks
			Min	Typ	Max		
Resolution	-	-	-	-	10	bit	
Total error	-	-	-3	-	+3	LSB	
Nonlinearity error	-	-	-2.5	-	+2.5	LSB	
Differential nonlinearity error	-	-	-1.9	-	+1.9	LSB	
Full scale transition voltage	V_{FST}	ANi	Typ -20	$AV_{RH5} - 1.5$ LSB	Typ +20	mV	between 1022 and 1023
Zero Transition Voltage	V_{ZT}	ANi	Typ -20	$AV_{SS5} + 0.5$ LSB	Typ +20	mV	between 0 and 1
Conversion Rate	T_S	pi _{jj} (ANi N)	353	-	1186	KS/s	
Comparison Time	T_{COMP}	-	646.8	-	-	ns	Fclk=17MHz, Tclk=58.8ns * 11 clocks
			-	-	2750	ns	AVDD5 = 4.5V...5.5V, Fclk=4MHz, Tclk=250ns * 11 clocks
			-	-	1837	ns	AVDD5 = 3.0V...4.5V, Fclk=6MHz, Tclk=167ns * 11 clocks
Analog input leakage current (during conversion)	I_{AIN}	ANn	-1	-	+1	μA	$T_A = 25^\circ\text{C}$, $AV_{SS5} < V_I < AV_{DD5}$, AV_{RH5}
			-3	-	+3	μA	$T_A \leq 105^\circ\text{C}$, $AV_{SS5} < V_I < AV_{DD5}$, AV_{RH5}
Analog input voltage range	V_{AIN}	ANn	AV_{SS5}	-	AV_{RH5}	V	
Reference voltage range	AV_{RH5}	AV_{RH5}	$AV_{DD5} - 0.5$	-	AV_{DD5}	V	
Power supply current	I_A	AV_{DD5}	-	2	3.4	mA	A/D Converter active
	I_{AH}	AV_{DD5}	-	-	6	μA	25°C, A/D Converter not operated
			-	-	11	μA	105°C, A/D Converter not operated
Reference voltage current	I_R	AV_{RH5}	-	0.6	1	mA	A/D Converter active
	I_{RH}	AV_{RH5}	-	-	0.6	μA	A/D Converter not operated
Offset between input channels	-	ANn	-	-	4	LSB	

Note

27. The accuracy gets worse as $|AV_{RH5}|$ becomes smaller.

Minimum Sampling Time

The minimum sampling time can be calculated from the following formula:

For pins ADC0_AN0..25:

$$T_{\text{samp}} = 7.63 \times [R_{\text{ext}} \times (C_{\text{ext}} + 16\text{pF}) + (R_{\text{ext}} + 1.78\text{kOhm}) \times 18.7\text{pF}]$$

For Pins ADC0_AN26..31:

$$T_{\text{samp}} = 7.63 \times [R_{\text{ext}} \times (C_{\text{ext}} + 16\text{pF}) + (R_{\text{ext}} + 1.78\text{kOhm}) \times 2.6\text{pF} + (R_{\text{ext}} + 3.55 \text{ kOhm}) \times 18.7\text{pF}]$$

Definition of A/D Converter Terms

- Resolution: Analog variation that is recognized by an A/D converter.
- Total error: Difference between the actual value and the ideal value. The total error includes zero transition error, full-scale transition error and nonlinearity error.
- Nonlinearity error: Deviation between a line across zero-transition line (00 0000 0000 <--> 00 0000 0001) and full-scale transition line (11 1111 1110 <--> 11 1111 1111) and actual conversion characteristics.
- Differential linearity error: Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.
- Zero reading voltage: Input voltage which results in the minimum conversion value.
- Full scale reading voltage: Input voltage which results in the maximum conversion value.

Figure 14. Total Error of Digital Output
Total error

$$\text{Total error of digital output "N"} = \frac{V_{NT} - \{1 \text{ LSB} \times (N-1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$1 \text{ LSB} = (\text{Ideal value}) \frac{AVRH}{1024} \text{ [V]}$$

N : A/D converter digital output value

$$V_{OT} \text{ (Ideal value)} = 0 + 0.5 \text{ LSB [V]}$$

$$V_{FST} \text{ (Ideal value)} = AVRH - 1.5 \text{ LB [V]}$$

V_{NT} : A voltage at which digital output transition from (N-1) to N.

FLASH Memory Program/Erase Characteristics

($T_A = -40\text{ }^{\circ}\text{C}$ to $105\text{ }^{\circ}\text{C}$, $V_{DD} = 1.1\text{V}$ to 1.3V , $V_{DP3} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

Table 61. Program/Erase Time for TCFLASH and EEFLASH

Parameter		Value			Unit	Remarks
		Min	Typ ^[28]	Max		
Sector Erase Time	Small Sector	-	0.3	1.1	s	The internal programming time before the erase procedure starts is included.
	Large Sector	-	0.7	3.7	s	
Macro Erase Time	TCFLASH	-	13.6	68	s	
	EEFLASH	-	2.4	8.8	s	
Word Programming Time		-	12	384	μs	

Note

28. Typical definition: $T_A=25^{\circ}\text{C}$ / $V_{DD}=1.2\text{V}$ / Program/Erase cycle = Immediately after shipment.

Table 62. Program/Erase Cycle and Data Retention Time^[29]

Program/Erase Cycle at Each Sector		Data Retention Time	
Min Value	Unit	Min Value	Unit
1000	cycles	20	years
10000	cycles	10	years
100000	cycles	5	years

Note

29. These values were converted from the technology qualification using Arrhenius equation to translate high temperature measurements into normalized values at $+85^{\circ}\text{C}$.

Table 63. Execution Time Limit

Parameter	Value	Unit
Program Execution Time limit ^[30]	1.3	ms
Macro Erase Execution Time limit	TCFLASH	187.2
	EEFLASH	63
Sector Erase Execution Time limit ^[31]	7.8	s

Note

30. This is the time it takes for the macro to detect a Hang up 1 error when 1 is to be programmed to a memory cell whose memory value is either 0 or X.

31. See the Hardware Manual for an explanation about Flash Timing Limit Exceeded Flags. The time during Sector Erase Suspend (period from Suspend Command Write Cycle to Resume Command Write Cycle) is not included.

RC Oscillator Frequency

This chapter provides reference values for the RC Configuration Register (SYSC_RCCFGR) settings. The corresponding oscillator is commonly referred to as the “12 MHz RC Oscillator”, because its typical frequency at the central setting is about 12 MHz, with the SYSC_RCCFGR:SFREQ bit set to “1”.

When the SYSC_RCCFGR:SFREQ bit is set to “0”, the central setting corresponds to about 8 MHz.

The default value of SYSC_RCCFGR:SFREQ is “1” and the default value of SYSC_RCCFGR:TRM[7:0] is “0xFF”, so the default frequency setting is 16.9 MHz (typical value).

Figure 15. RC Oscillator Frequency at SYSC_RCCFGR:SFREQ = 0

Note

32. The provided function values are not guaranteed and can serve for reference, only. Guaranteed values are listed in [Table 47 on page 349](#).

Figure 16. RC Oscillator Frequency at SYSC_RCCFGR:SFREQ = 1

Note

33. The provided function values are not guaranteed and can serve for reference, only. Guaranteed values are listed in [Table 47 on page 349](#).

ESD Structure between Power Domains

There are ESD diodes between VDD, VDP3 and VSS to protect VDD against ESD overvoltage.

Procedures

Boundary Scan

Boundary scan is supported using standard IEEE 1149.1 JTAG interface. A 5-pin JTAG connection is available on QFP-176 (production variant), as well as QFP-240 (bond-out variant). Instruction register supported is 6-bits wide, and the standard instructions listed in [Table 64 on page 372](#) are supported. Any other value of instruction register is reserved, and should not be entered. Entering reserved values can result in indeterminate operation.

Boundary scan mode may be entered by setting pins MODE = “1” and MD[0] = “0”.

Table 64. Standard Instructions

Instruction Code (in Binary)	Instruction	Accessible Data Register	Remarks
'000000'	EXTEST	Boundary scan chain	
'000001'	SAMPLE	Boundary scan chain	
'000010'	PRELOAD	Boundary scan chain	
'000011'	IDCODE	Device ID code register	For MB9EF226, IDCODE is 0x0F159009
'000100'	USERCODE	Device user code register	For MB9EF226, USERCODE is 32-bits long, and is 0xC4202012
'000101'	HIGHZ	Boundary scan chain	
'000110'	CLAMP	Boundary scan chain	
'010001'	IO_CNTRL	IO Control register	Command must be followed by 16bit data value: 0x04pp, where “pp” is a pin control setting from Table 65 .
'111111'	BYPASS	Bypass register	

Table 65. IO Control (IO_CNTRL) Register

IO_CNTRL

Note

34. When Bit[10] = "0", all input buffers are disabled in Boundary Scan mode. Then, input of data via external pins to the BSR (Boundary Scan Register) is impossible. Therefore, the minimum setting to allow input to the BSR is 0x0400.

Procedure for Configuration for Port Input:

1. MODE clipped to '1' and MD[0] clipped to '0'.
2. Release JTAG_Nrst and RSTX.
3. JTAG-Instruction IO_CNTRL (010001).
4. Set IO_CNTRL-reg 10th bit: (For example, 0000010000000000).
5. JTAG-Instruction SAMPLE > Port Input.

The serial chain starts with the I/O closest to JTAG_TDI pin, and ends with the I/O closest to the JTAG_TDO pin. Details may be obtained from BSDL files (see http://mcu.emea.fujitsu.com/mcu_portal.htm) released per package.

Flash Parallel Programming

Flash Parallel Programming (FPP) mode is supported to allow for quick programming/erase of embedded flashes. In this mode program or erase of flash is done using a flash memory programmer directly via external pins. Flash programming is done either in 8-bit or 16-bit mode through the command sequence. Refer Section 4 of Tightly Coupled Flash Chapter of HWM for details of Flash program/erase command sequence.

Flash addressing in this mode is direct physical addressing, with higher order bits used for flash macro selection.

In MB9EF226 device, there are 2 flash macros of 1MB+64KB size and 1 flash macro of 64KB. Details about flash macro sectoring are shown in [Table 67](#).

Table 67. Flash Sector Information

Flash Macro	Macro size	Small Sectors (8KB/sector)	Large sectors (64KB/sector)
TCFLASH macro 0	1MB + 64KB	8	16
TCFLASH macro 1	1MB + 64KB	8	16
EEFLASH macro	64KB	8	Not Available

Details about mapping of flash pins to external pins are presented in [Table 68](#).

Table 68. Flash Pin Mapping to External Pins

External Pin Number (QFP-176)	External Pin Number (QFP-240)	External Pin Name	Flash macro pin	Function
93	128	P1_47	DFSEL	Flash select signal. Refer Table 74 on page 381 for additional details regarding use of DFSEL.
3	3	X0	FCLK	Flash clock
1	1	MODE	MODE	Mode pin to enter test mode (MODE = '1')
7	8	RSTX	RSTX	Device Reset pin

Note

35. Input Data should change at falling edge of X0 clock.

36. Output data should be sampled at next rising edge of X0 clock

Memory Map

This flash memory consists of 16 sectors of 64k byte (large sector) and 8 sectors of 8k byte (small sector).

A large sector is composed of 16k word, and a small sector is composed of 2k word. 1word data width is 39 bit (regular bit: 32 bit + ECC parity bit: 7bit) for both large sector and small sector.

Address Space and Memory Cell Select Address Assignment

The select address assignment is listed below. The assignment in the large sector and that in the small sector differ.

When the small sector (FA[20]=0) is selected, no matter what the values (1/0) of FA[19:16] are, the memory cell to be used is determined according to the values of FA[15:0].

- Large Sector (0x100000 ~ 0x1FFFFFF)

Table 70. Large Sector (0x100000 ~ 0x1FFFFFF)

FA[20]	FA[19:16]	FA[15:2]	FA[1:0]
1	Sector selection (16large sector)	Select a word in the sector (16,384word)	Select a Byte in the word(32bit)

- In read or program mode, an address pin input is ignored as shown below. Apply a given value (1/0) to the corresponding pin. For the correspondence between data output pins and data input pins, see [Output Data Table](#) and [Input Data Table](#).

8 bit program mode (BYTEX=0): Ignore none of FA[20:0] and input 8bit selected in FA[20:0].

16 bit program mode (BYTEX=1): Ignore FA[0] and input 16 bit.

- FPP mode can only output 8 or 16 bit.
- RD64 should always be kept 0.
- BYTEX=0: DQ[7:0] is used
- BYTEX=1: DQ[15:0] is used

- Small Sector (0x0*0000 ~ 0x0*FFFF)

Table 71. Small Sector (0x0*0000 ~ 0x0*FFFF)

FA[20]	FA[15:13]	FA[12:2]	FA[1:0]
0	Sector selection (8small sector)	Select a word in the sector (2,048word)	Select a Byte in the word(32bit)

The left asterisk mark in the value indicates a given value (except an indeterminate value).

- When small sector is selected (FA[20]=0), input a given value (1/0) to FA[19:16] pins.
- In read or program mode, an address pin input is ignored as shown below. Apply a given value (1/0) to the corresponding pin. For the correspondence between data output pins and data input pins, see [Output Data Table](#) and [Input Data Table](#).

8bit program mode (BYTEX=0): Ignore none of FA[20,15:0] and input 8bit selected in FA[20,15:0].

16bit program mode (BYTEX=1): Ignore FA[0] and input 16bit.

- FPP mode can only output 8 or 16 bit.
- RD64 should always be kept 0.
- BYTEX=0: DQ[7:0] is used
- BYTEX=1: DQ[15:0] is used

Output Data Table

In 32 bit read mode, the data is output to different output pins based on the sector-selected lowest address values as shown in [Table 72](#).

Table 72. Data Output Correspondence Table in Read Bit Modes

Bit Mode	RD64	Select Address			Data output pins					
		FA[#]	FA[1]	FA[0]	DOR[63:32]	DOR[31:0]	EDOR[13:7]	EDOR[6:0]	DOV[15:8]	DOV[7:0]
64bit	1	1/0	1/0	1/0	Odd. Sector Regular bit 31-0	Even Sector Regular bit 31-0	Odd. Sector Parity bit 6-0	Even Sector Parity bit 6-0	Status 7-0	Status 7-0
32bit	0	1	1/0	1/0	Odd. Sector Regular bit 31-0	X	Odd. Sector Parity bit 6-0	X	Status 7-0	Status 7-0
		0	1/0	1/0	X	Even Sector Regular bit 31-0	X	Even Sector Parity bit 6-0	Status 7-0	Status 7-0

- FA[#] indicates the lowest bit of sector-selected address, i.e. FA[16] when the large sector is selected (FA[n]=1), and FA[13] when the small sector is selected (FA[n]=0).
- Even Sector indicates an even-number-th sector (large sector FA[16]=0 / small sector FA[13]=0). Odd Sector indicates an odd-number-th sector (large sector FA[16]=1 / small sector FA[13]=1) "even-number-th" and "odd-number-th" respectively indicate the even number and odd number in Sector No. values shown in [Memory Map](#).

Input Data Table

In 8 bit program mode, the data of the different input pins based on the FA[0] values is programmed as shown in [Table 73](#).

When ECCA=1 is input at the program data input, the data is written to ECC parity bit as well as Regular bit. When ECCA=0 is input at the program data input, the data is written only to Regular bit. In this case, EDIN[6:0] input value is "don't care," and regardless of the value, no value is written to ECC parity bit. In the case of erase operation, regardless of input values to ECCA, both Regular bit and ECC parity bit are erased together.

Table 73. Correspondence Table of Data Input and Memory Cell Bit in Program Bit Modes

Bit Mode	BYTEX	Write Cycle	Select Address				Data Input pins					
			FA[#]	FA[1]	FA[0]	ECCA	DIN[15:8]	DIN[7:0]	EDIN[6:0]			
16bit	1	Command data input	1/0	1/0	1/0	1/0	any	command data 7-0	any			
		Program data input	1	1	1	1/0	1	Odd. Sector Regular bit 31-24	Odd. Sector Regular bit 23-16	Odd. Sector Parity bit 6-0		
					0	1/0	0	any	any			
			0	1	1	1/0	1	Odd. Sector Regular bit 15-8	Odd. Sector Regular bit 7-0	Odd. Sector Parity bit 6-0		
					0	1/0	0	any	any			
		0	1	1	1/0	1	1	Even Sector Regular bit 31-24	Even Sector Regular bit 23-16	Even Sector Parity bit 6-0		
						0	1	0	any	any		
			0	1	1/0	1	1	Even Sector Regular bit 15-8	Even Sector Regular bit 7-0	Even Sector Parity bit 6-0		
0	1					0	any	any				
8bit	0	Command data input	1/0	1/0	1/0	1/0	any	command data 7-0	any			
		Program data input	1	1	1	1	1	Odd. Sector Regular bit 31-24	any	Odd. Sector Parity bit 6-0		
						0	1	0	any	Odd. Sector Regular bit 23-16	Odd. Sector Parity bit 6-0	
				0	1	1	1	1	Odd. Sector Regular bit 15-8	any	Odd. Sector Parity bit 6-0	
							0	1	0	any	Odd. Sector Regular bit 7-0	Odd. Sector Parity bit 6-0
				0	1	1	1	1	1	Even Sector Regular bit 31-24	any	Even Sector Parity bit 6-0
								0	1	0	any	Even Sector Regular bit 23-16
			0		1	1	1	1	1	Even Sector Regular bit 15-8	any	Even Sector Parity bit 6-0
								0	1	0	any	Even Sector Regular bit 7-0
			0	1	1	1	1	1	any	any	any	
							0	1	0	any	any	
				0	1	1	1	1	1	any	any	any
								0	1	0	any	any

- "Any" a value of either 1 or 0.
- FA[#] indicates the lowest bit of sector-selected address, i.e. FA[16] when the large sector is selected (FA[n]=1), and FA[13] when the small sector is selected (FA[n]=0). When programming, in both 8bit mode and 16bit mode, program/erase operation is executed per one sector specified by the selected addresses.
- Program Data Input means the 4th write cycle of a program command in the normal operation state and the 2nd write cycle of a program command in the Unlock-bypass state.
- Command Data Input means the write cycles in the write command sequence other than those mentioned above in which program data is input.

Flash Macro Selection and Address Mapping in FPP

The TC-Flash macro can be accessed using the address decoding scheme as mentioned in [Table 74](#).

Table 74. Flash Macro Selection

DFSEL	FA[21]	Flash Macro Selection
0	0	TCFLASH macro 0
0	1	TCFLASH macro 1

However, device level memory map differs from actual physical address to flash macro. Hence, it is expected that the flash parallel programmer must translate CPU mode addressing to actual physical address to flash. Hence, CPU execution code must be located at physical addresses that are mapped to the CPU mode addresses.

Translation of CPU mode address to actual physical address differs based on whether small or large sectors are accessed.

[Table 75](#) provides the address translation for small sectors of TCFLASH macro 0 and 1.

Table 75. TCFlash Small Sectors Address Translation

Flash Address Bit	CPU Address Bit
FA[21]	0
FA[20]	0
FA[19]	0
FA[18]	0
FA[17]	0
FA[16]	0
FA[15]	ADDR[15]
FA[14]	ADDR[14]
FA[13]	ADDR[02]
FA[12]	ADDR[13]
FA[11]	ADDR[12]
FA[10]	ADDR[11]
FA[09]	ADDR[10]
FA[08]	ADDR[09]
FA[07]	ADDR[08]
FA[06]	ADDR[07]
FA[05]	ADDR[06]
FA[04]	ADDR[05]
FA[03]	ADDR[04]
FA[02]	ADDR[03]
FA[01]	ADDR[01]
FA[00]	ADDR[00]

Note

37. Small sectors are interleaved (even and odd sectors). Even numbered sectors provide lower 4 byte and odd numbered sectors provide upper 4 byte of a 64 bit FLASH line.

Table 76 provides the address translation for large sectors of TCFlash.

Table 76. TCFlash Large Sectors Address Translation

Flash Address Bit	CPU Address Bit
FA[21]	ADDR[03]
FA[20]	1
FA[19]	ADDR[20]
FA[18]	ADDR[19]
FA[17]	ADDR[18]
FA[16]	ADDR[02]
FA[15]	ADDR[17]
FA[14]	ADDR[16]
FA[13]	ADDR[15]
FA[12]	ADDR[14]
FA[11]	ADDR[13]
FA[10]	ADDR[12]
FA[09]	ADDR[11]
FA[08]	ADDR[10]
FA[07]	ADDR[09]
FA[06]	ADDR[08]
FA[05]	ADDR[07]
FA[04]	ADDR[06]
FA[03]	ADDR[05]
FA[02]	ADDR[04]
FA[01]	ADDR[01]
FA[00]	ADDR[00]

Note

- 38. Large sectors of TCFLASH are 4-times interleaved for best read performance (see also HW/Manual fig. 9.3-2 TCFLASH sector/address mapping - CPU mode).
- 39. Large sectors are interleaved (even and odd numbered sectors). Even numbered sectors provide lower 4 byte and odd numbered sectors provide upper 4 byte of a 64 bit FLASH line.
- 40. Address space is interleaved between TCFLASH0 and TCFLASH1. TCFLASH0 keeps lower 8 byte and TCFLASH1 keeps upper 8 byte of a 128 bit FLASH line (2 FLASHs are read in parallel).

The EFlash macro can not be programed in FPP mode with respect to SHE security.

Flash Power On Sequence

Prior to entering flash parallel programming mode, the sequence mentioned below must be followed:

1. Apply following constant pin setting: MODE = 1 and MD[2:0] = 111. The pins for MD[2:0] have pull-up, thus can be left open.
2. Assert RSTX = 0 and JTAG_nTRST = 0. The pin JTAG_nTRST has pull-down, so it will be kept in reset by the device if it is left open. Asserting FRSTX = 0 and FRSTRX = 0 is optional. This is done internally at device startup.
3. Ramp up the power supply (please refer to device specific datasheet for power supply sequence) and wait till all power supplies (VDP5, VDP3 & VDD) are stable
4. Wait for at least 500ns after all power supplies are stable.
5. De-assert RSTX= 1, also deassert FRSTX = 1 and FRSTRX = 1 if those were asserted before.
6. Wait until Flash Parallel Programming mode is entered by the bootROM program (boot time). Wait time should be >=2.5 ms after RSTX release. Note that the wait time is necessary because RDY pin is High-Z before FPP mode is entered. Looking at RDY (which has pull-up) alone would cause mis-interpretation before that time is elapsed.
7. Flash access is possible after RDY pin goes to "1". Clock supply is needed for monitoring RDY.

RDY pin is pseudo open drain and thus needs a pull-up resistor. That makes it possible to program multiple devices at once by using wired-AND of the RDY outputs, to detect when slowest device becomes ready.

Failure to follow the above sequence can result in indeterminate behavior. Once the above sequence is completed, flash parallel programming mode may be entered.

Flash parallel programming mode standard usage:

Entering FPP by releasing RSTX while keeping.

- MODE = '1'
- MD[1] = '1', MD[0] = '1'
- SMD[2] = '1', SMD[1] = '1', SMD[0] = '1'

Furthermore, Flash parallel programming mode may be entered using 2 options:

1. Setting MCFG_DTAR:FPPREQ
2. Setting MCFG_TSR:MD= 'XXX111', and MCFG_TSR:SMD= '11111'

Once flash parallel mode is requested, the bit SYSC_MCR:FPPEN is set, which enables entry to FPP mode. However, it must be noted that FPP access must also be enabled in Security Description Record (SDR) (see HWM).

The external programmer must also take care to program ECC bits for flash data contents. This also applies to flash erase, where bit flipping (XOR with 0x73) is to be performed to handle ECC checking for erased flash.

Figure 24. Power On Sequence

Recommendation: FRSTX = FRSTRX = '1'

Table 77. Timing Parameters Related to Power ON Sequence

Parameter	Symbol	Value		Unit
		Min	Max	
Hardware Reset(FRSTX=0) period	tRP	440	-	ns
Hardware Reset(RSTX=0) period	tRP	500	-	ns
FRSTRX fall to RDYR fall access	tARYR	-	80	ns
FRSTX fall to RDY reset	tARY	-	80	ns
FRSTRX rise to RDYR rise access	tREGRDYR	-	80	ns
FRSTRX rise to RDY rise access	tREGRDY	-	80	ns

Debug and Trace

A standard 5-pin JTAG interface is supported for debug and trace. Conventional debug (core halted, and invasive) as well as trace debug (core not halted and non-invasive) are supported. The procedures for debug and trace rely on ARM Coresight technology. The salient features for debug are:

- Secure mode entry for debugger
- Up to 8 breakpoints, or 8 watchpoints

Tracing support is provided on both packages as shown below:

- QFP-176: 4-bit and 8-bit trace data shared with resources.
- QFP-240: 4-bit, 8-bit and 16-bit trace data with dedicated trace pins

Table 78 provides the trace port to pin mapping in QFP-176 and QFP-240 packages.

Table 78. Trace Port to External Pin Mapping

External Pin Number (QFP-176)	External Pin Number (QFP-240)	External Pin Name	Trace Port
-	95	TRACECTL	CTL
-	100	TRACECLK	CLK
-	20	TRACE[00]	TRACE[00]
-	25	TRACE[01]	TRACE[01]
-	37	TRACE[02]	TRACE[02]
-	46	TRACE[03]	TRACE[03]
-	63	TRACE[04]	TRACE[04]
-	68	TRACE[05]	TRACE[05]
-	76	TRACE[06]	TRACE[06]
-	85	TRACE[07]	TRACE[07]

Table 78. Trace Port to External Pin Mapping (Continued)

External Pin Number (QFP-176)	External Pin Number (QFP-240)	External Pin Name	Trace Port
-	90	TRACE[08]	TRACE[08]
-	105	TRACE[09]	TRACE[09]
-	109	TRACE[10]	TRACE[10]
-	113	TRACE[11]	TRACE[11]
-	118	TRACE[12]	TRACE[12]
-	123	TRACE[13]	TRACE[13]
-	126	TRACE[14]	TRACE[14]
-	129	TRACE[15]	TRACE[15]

Package QFP-176 has no dedicated trace pins. See the Port Pin Multiplexing table (see [Table 17](#)) in [Port Pin Multiplexing](#) for relevant pins and the corresponding settings for their activation.

In general, additional information regarding debug and trace methodology can be obtained from Coresight TRM provided by ARM Limited. However, an additional characteristic is the support of security feature to prevent unauthorized access through the debug port. At the time of initiating the debugger access, it depends on the security configuration of the device, whether it is necessary to transmit a security key. The security key can only be transmitted once after reset. If a wrong key is entered, further accesses are disabled, and the only method to regain access is through application of external reset.

In the device, trace support is provided for the following components/buses:

1. Embedded Trace Macro (ETM) and Instrumentation Trace Macro (ITM) for processor core
2. Independent AHB bus trace macro (HTM) for up to 8 busses (see [Table 79](#)).

Further, Cross Trigger Interface (CTI) macros are included to support cross triggering among all the above macros.

Table 79. HTM Trace Sources

Bus	Width (Bits)	Source ID
DMA master	64	1
PERI4 master	32	2
MEMORY_CONFIG slave	64	3
MCU_CONFIG slave	32	4
PERI5 slave	32	5
PERI3 slave	64	6
PERI4 slave	32	7
HSSPI slave	32	8

Power domain on/off status information can be obtained through debug port by accessing register on memory mapped address 0xB0509400. This provides an easy method to obtain information on current state of power domains, without the need to access device level internal registers. Refer [Table 80](#) on page 384 for details.

Table 80. Power Domain Status Information for Debugger

Bit Number	Function
31:3	Reserved
2	PD4 on/off status '0' : Power domain is off '1' : Power domain is on
1	PD3 on/off status '0' : Power domain is off '1' : Power domain is on
0	PD2 on/off status '0' : Power domain is off '1' : Power domain is on

In the QFP-240 pin package, trace data width settings are configurable on the non-shared pins through register at memory mapped address 0xB0509404 (see [Table 81](#)).

Table 81. Trace Width Setting on QFP-240 Package

Bit Number	Function
31:7	Reserved
6	'1' : Trace clock (CLK) is driven on pin
5	'1' : Trace control (CTL) is driven on pin
4	'0' : reserved
3	'1' : bits 15 to 8 of trace data are driven on pins
2	'1' : bits 7 to 4 of trace data are driven on pins
1	'1' : bits 3 to 2 of trace data are driven on pins
0	'1' : bits 1 to 0 of trace data are driven on pins

Handling Devices

Preventing Latch-up

Latch-up may occur in a CMOS IC if a voltage higher than (V_{DD} , V_{DP3} or V_{DP5}) or less than (V_{SS}) is applied to an input or output pin or if a voltage exceeding the rating is applied between the power supply pins and ground pins. If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Therefore, be very careful not to apply voltages in excess of the absolute maximum ratings.

Handling of Unused Input Pins

If unused input pins are left open, abnormal operation may result. Any unused input pins should be connected to pull-up or pull-down resistor ($2K\Omega$ to $10K\Omega$) or enable internal pullup or pulldown resistors (PUE/PDE) before the input enable (PIE) is activated by software. The pins of circuit type MODE can be connected to V_{SS} or V_{DP5} directly.

Power Supply Pins

In FCR4 series, devices including multiple power supply pins and ground pins are designed as follows: pins necessary to be at the same potential are interconnected internally to prevent malfunctions such as latch-up. All of the power supply pins and ground pins must be externally connected to the power supply and ground respectively in order to reduce unnecessary radiation, to prevent strobe signal malfunctions due to the ground level rising and to follow the total output current ratings. Furthermore, the power supply pins and ground pins of the FCR4 series must be connected to the current supply source via a low impedance. It is also recommended to connect a ceramic capacitor of approximately $0.1 \mu F$ as a bypass capacitor between power supply pin and ground pin near this device. If DV_{CC} is not set to the same voltage level as AV_{DD5} , the ZPD functionality of SMC pins cannot be used.

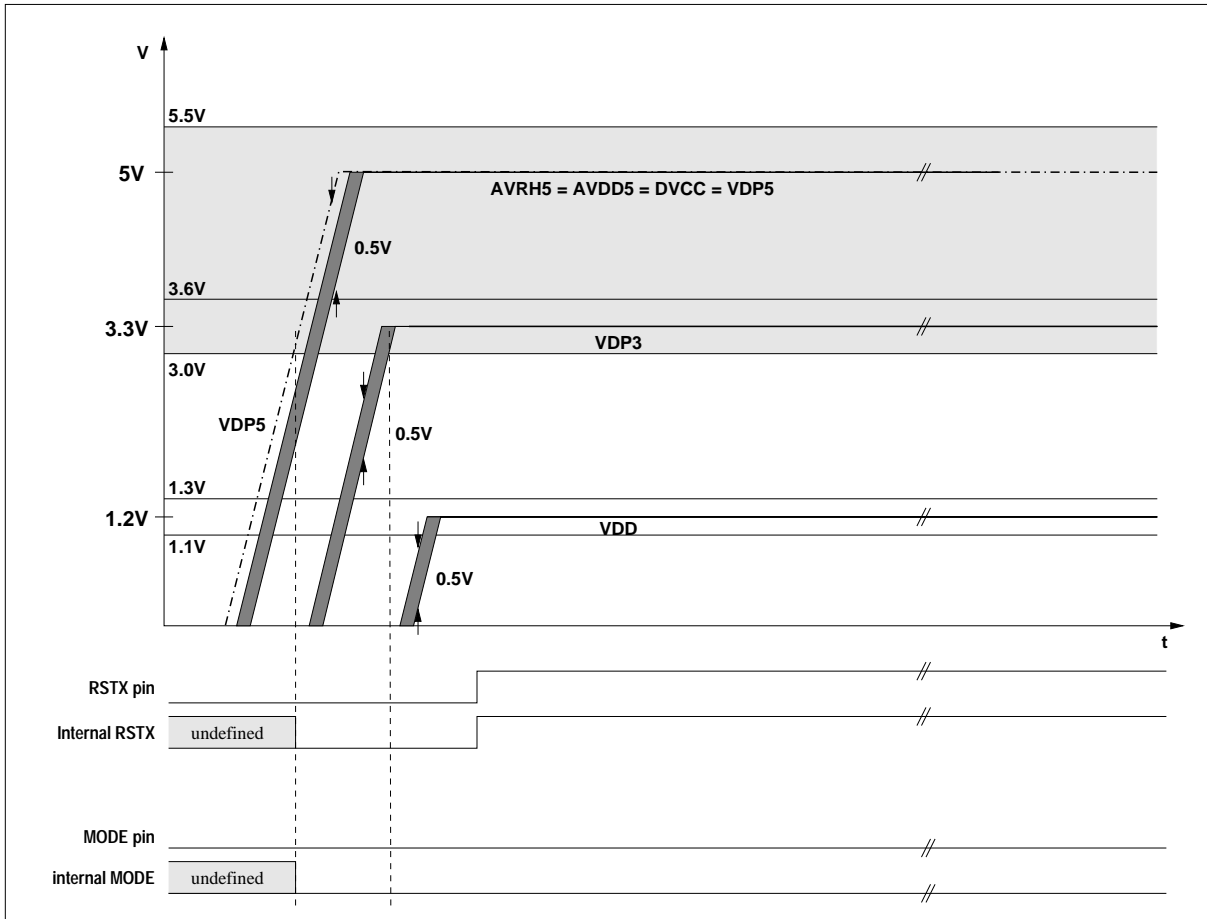

Power on Sequence

At any time, the difference between the power supply pins belonging to the same voltage level must not exceed 0.5V. This especially applies to the power on sequence. Otherwise, the risk of latchup will increase. [Figure 25](#) shows the power on sequence and the groups of power supply that might be used, depending on the actual application.

Furthermore, V_{DP5} supply must be switched on before any other power supply or at least at the same time. The following conditions must be fulfilled at any moment:

1. The voltage of V_{DP5} must be higher or equal than the voltage on AV_{DD5} and AV_{RH5} .
2. The voltage of V_{DP3} must be higher or equal than the voltage on V_{DD} . In particular, V_{DP3} must not be switched off for saving power.
3. The supply voltage for MODE and RSTX pins must reach the minimum operational value before switching on core voltage supply.

Figure 25. Power on Sequence

Pin State During Active External Reset

Table 82 shows the state of output/bidirectional pins during External Reset. For subsequent reset or power saving states, the pin state can be programmed according to the possibilities listed in HWM. Before software execution is started, however, the user must pay attention to the listed behavior.

Table 82. Pin State During Active External Reset

Pin Type	Reset State
JTAGO	HIZ
BIDI50	HIZ
BIDI33	HIZ
SMC	HIZ
I2C	HIZ
RSDS	HIZ
TTL33	HIZ

Crystal Oscillator Circuit

Noise in proximity to the X0/X0A and X1/X1A pins can cause the device to operate abnormally. Printed circuit boards should be designed so that the X0/X0A and X1/X1A pins, and crystal oscillator, as well as bypass capacitors connected to ground, are located near the device and ground.

It is recommended that the printed circuit board layout be designed such that the X0/X0A and X1/X1A pins are surrounded by ground plane for the stable operation.

Please request the oscillator manufacturer to evaluate the related characteristics of the crystal and this device.

Notes on Using External Clock

Opposite Phase Clock Supply: Oscillation Mode

When using the external clock, it is possible to simultaneously supply the X0/X0A and X1/X1A pins. In the described combination X0/X0A should be supplied with a clock signal which has the opposite phase to the X1/X1A pins. However, in this case the stop mode (oscillation stop mode) must not be used (This is because the X1/X1A pin stops at “H” output in STOP mode).

With opposite phase supply at X0 and X1, a frequency up to 16 MHz is possible.

Example of Using Opposite Phase Supply

Figure 26. Example of Using Opposite Phase Supply

Single Phase Clock Supply

For lower frequencies, up to 4 MHz, it is possible to supply a single phase clock at X0.

Figure 27. Example of Using Single Phase Supply

Single Phase Clock Supply: Fast Clock Input Mode

When a high frequency clock needs to be fed, it is possible to directly supply a single phase clock at X0. For this mode:

- SYSC_SPCCFGR:FCIMEN bit must be set to "1".
- The input clock must have 50% duty cycle.

Example of Using Fast Clock Input Mode

Figure 28. Example of Using Fast Clock Input Mode

Unused Sub Clock Signal

If the pins X0A and X1A are not connected to an oscillator, a pull-down resistor must be connected on the X0A pin and the X1A pin must be left open.

1. TCFlash Programming

■Problem Definition

TCFlash programming problem was found in the logic of the TCFlash Interface in the MB9EF226 series. Because of this problem, the behavior of the TCFlash programming is not working as specified.

■Parameters Affected

All part numbers of the MB9EF226 series are affected.

■Trigger Condition

Programming the TCFlash with ECC is not possible with 16 bit access sequences.

■Rootcause

Data abort of 16 bit programming sequence.

■Workaround

To handle ECC calculation and Flash writes, Flash write in CPU mode is restricted to 32-bit mode.

■Fix Status

No fixes planned.

2. Port Pin Output Function Select Problem

■Problem Definition

Port Pin Output Function Select problem was found in the logic of the port pin multiplexing on MB9EF226 series. Because of this problem, the behavior of the port pin multiplexing is not working as specified.

■Parameters Affected

All part numbers of the MB9EF226 series are affected.

■Trigger Condition

The problem occurs if the port pin output function select value '010' is programmed for port pin P2_40, P2_41, P2_42 or P2_43.

■ **Rootcause**

The port pin output function select value '010' for port pin P2_40, P2_41, P2_42, P2_43 does not select the specified output function.

■ **Workaround**

Do not program pin output function select value '010' for port pin P2_40, P2_41, P2_42, P2_43.

To use the resources specified for port pin output function select value '010' on port pin P2_40, P2_41, P2_42, P2_43 select another specified port pin location for the corresponding resource functional output.

Note The pin output function RTC_WOT, SYSC_CKOT, SYSC_CKOTX, WDG_OBSERVE specified on port pin P0_40, P0_41, P0_42, P0_43 are only supported when power domain PD2 is active.

■ **Fix Status**

No fixes planned.

3. 3V IO Domain ESD Diode

■ **Problem Definition**

The 3V IO domain ESD diode problem was found in the specific use-case of switching off the VDP3 supply (3V IO domain) in the MB9EF226 series.

Due to an ESD diode between VDD (core supply) and VDP3 (3V IO domain supply), the voltage on VDP3 does not reach 0V even if not supplied.

External components connected to same supply as VDP3 will be supplied with a voltage around 0.55V from VDD supply. Therefore, power saving target in standby modes may not be achieved.

■ **Parameters Affected**

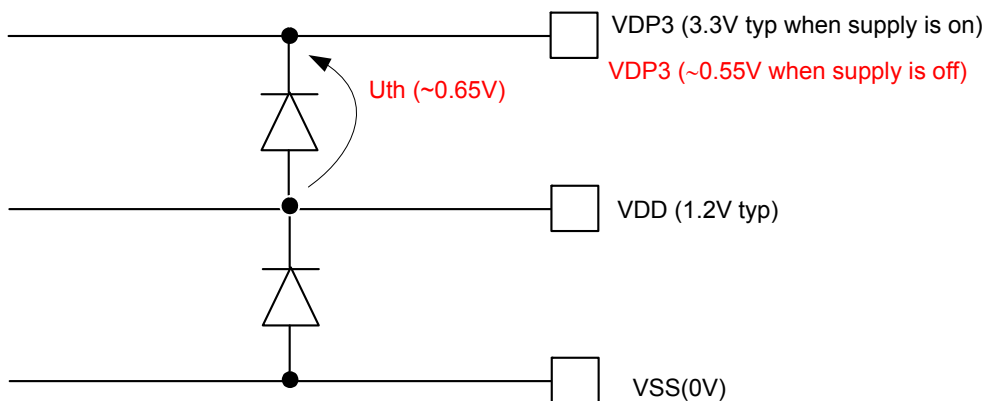

All part numbers of the MB9EF226 series are affected.

■ **Trigger Condition**

The problem occurs if the supply of the 3V IO domain (VDP3) is switched off.

■ **Rootcause**

There is an ESD diode between VDD and VDP3 in the core supply cell to protect VDD against ESD overvoltage.

In case VDP3 supply is switched off, then VDP3 is supplied by VDD - Uth (threshold voltage of diode) which is around $1.2V - 0.65V = 0.55V$.

■ **Workaround**

Choose any one of the following workaround:

- Keep 3V power on in standby modes, or
- Switch 3V power off in standby modes, and use separated supplies of MCU and external components to avoid external components being supplied via ESD diode, or
- Switch 3V power off in standby modes, and use same supply of MCU and external components, but do not exceed the maximum current limit of forward-biased diode which is 4mA, i.e. current on VDP3 must not exceed 4mA in that case.

■ **Fix Status**

No fixes planned.

4. IRQ Unit Register Read Timing Issue

■ Problem Definition

The IRQ Unit register read timing issue was found in the Interrupt Unit (i.e., IRQ-Unit or I-Unit) on the MB9EF226 series. Due to this problem, data from I-Unit registers may be invalid when read at CLK_MEM_I_PD3 frequencies higher than 64 MHz (even though CLK_MEM_I_PD3 maximum frequency is specified up to 128MHz).

The following are not affected by the timing issue:

- Write accesses to Interrupt Unit
- IRQ vector address transfer to CPU via ARM VIC port (if enabled)

■ Parameters Affected

All part numbers of the MB9EF226 series are affected.

■ Trigger Condition

The problem may occur at the following conditions:

- CLK_MEM_I_PD3 is set to more than 64MHz, and
- Data is read from I-Unit addresses (0xB0400000 - 0xB0400D57) or IRQ0_NMIVAS mirror register at address 0xFFFFFBFC

Since occurrence of this timing issue is depending on logic path delays, the probability of reading invalid data is increasing with:

- Higher temperature conditions than room temperature
- Lower voltage conditions on VDD supply than nominal 1.2V
- Wafer process slow conditions

■ Rootcause

The root cause for this problem is a misinterpretation of the internal specification document, which states that one wait cycle is inserted in AHB read transactions while reading of all registers of the interrupt controller module. In the RTL design, there is one additional wait cycle added on the AHB bus, but internally, there was just one pipeline register added to the register read paths. With this, the valid read data is captured after one clock cycle, and then simply delayed by another clock cycle. For creating the timing constraining of the interrupt controller module, it was incorrectly assumed that the register read data actually has two clock cycles 'time' until it is being captured (and then output to the AHB bus). This assumption then led to the incorrect introduction of a multicycle_path definition in the timing constraints file, which effectively causes a frequency relaxation of a factor of 2 for all register read accesses to interrupt controller registers.

■ Workaround

For workaround details, refer to "[Workaround for IRQ Unit Register Read Timing Issue](#)" on page 406.

■ Fix Status

Cypress is proposing software workaround specified in "[Workaround for IRQ Unit Register Read Timing Issue](#)" on page 406. Hardware redesigns are not planned.

5. Flash Erase Suspend Internal

■ Problem Definition

The functional limitation was found with Flash memory implemented in the MB9EF226 series. Data may not be read correctly irrespective on the state of erase suspend after the sector erase suspend command is issued to the Flash memory during sector erase.

■ Parameters Affected

All part numbers of the MB9EF226 series are affected.

■ Trigger Condition(s)

The limitation may occur under the all of following conditions are met:

- The sector erase suspend command is issued during sector erase.
- After it is shifted to the sector erase suspend state, the read operation from the same Flash memory is performed.

■ Details of the Limitation

Data may not be read correctly irrespective of the large sectors or small sectors if the following operations are executed in sequence:

- The sector erase suspend command is issued to the flash memory during sector erase.
- After the state of the sector erase suspend is completed, the reading operation for the flash memory (instruction read or data read) is performed.

In this case, the read data are undefined. After this read, data will remain undefined until the sector erase resume command is issued. [Table 95](#) provides the combination of operating conditions for flash memories.

Table 95. Combination of Operating Conditions for Flash Memories

	Flash Memory to Which the Sector Erase Suspend Command is Issued	Flash Memory from Which Data is Read	Read Value of Data in the Sector Erase Suspend State
1	TC Flash-A	TC Flash-A	Undefined
2	TC Flash-B	TC Flash-B	Undefined
3	EE Flash	EE Flash	Undefined
4	TC Flash-A	TC Flash-B / EE Flash	Normal
5	TC Flash-B	TC Flash-A / EE	Normal
6	EE Flash	TC Flash-A / TC Flash-B	Normal

Causes of the Limitation

The flash memory control circuit consists of the following two circuits:

- The circuit to control automatic algorithm execution for sector erase operation.
- The circuit, which receives the sector erase suspend command from the above mentioned circuit, to stop the automatic algorithm execution and to switch to the state where the read operation is enabled.

In this case, the circuit to switch the state have a problem, so it cannot to be changed to the state of read operation in case of receiving the sector erase suspend command.

■ Workaround

Refer to [Workaround for Flash Erase Suspend Internal on page 412](#).

■ Fix Status

Cypress is proposing software workaround specified in [Workaround for Flash Erase Suspend Internal on page 412](#). Hardware redesigns are not planned.

6. IUNIT Interrupt Handling Problem

■ Problem Definition

The IUNIT Interrupt Handling problem was found in the logic of the IUNIT in MB9EF226 series. Because of this problem the IUNIT is not working as specified.

- IRQ Priority Level Mask:

If enabled IRQ[n] is selected by the priority encoder (no other interrupt with higher priority pending and $IRQ0_IRQPLn < IRQ0_IRQPLM$) and $IRQ0_IRQPLM$ is changed to $IRQ0_IRQPLM \leq IRQ0_IRQPLn$ while the interrupt unit is waiting for the CPU to read the interrupt vector address, the interrupt hold status for IRQ[n] in $IRQ0_IRQHSn$ is not set.

- If IRQ[n] is active and $IRQ0_IRQPLM$ is set to $IRQ0_IRQPLM > IRQ0_IRQPL[n]$ before the interrupt flag at the peripheral is cleared and no enabled interrupt with high priority was asserted then IRQ[n] will be selected again for interrupt service.
- If IRQ[n]/IRQ[m] is active and $IRQ0_IRQPLM$ is set to $IRQ0_IRQPLM > IRQ0_IRQPL[m] > IRQ0_IRQPL[n]$ after the interrupt flag at the peripheral asserting IRQ[n] is cleared and no enabled interrupt with higher priority was asserted then IRQ[n] will be nested by IRQ[m].

- IRQ/NMI Priority Level:

$IRQ0_IRQPL0\sim127$, $IRQ0_NMIPL0\sim7$ are changed during interrupt priority evaluation.

- Wrong IRQ/NMI interrupt number and vector (even the number and vector of a non-existing IRQ/NMI interrupt) can be handed over to the CPU.
- One IRQ/NMI interrupt is executed, but the hold status bit of another IRQ/NMI interrupt (or no hold status bit or several hold status bits) may get set.

- IRQ/NMI Hold clear:

$IRQ0_IRQHC$, $IRQ0_NMIHC$ are written during interrupt priority evaluation.

- Wrong IRQ/NMI interrupt number and vector (even the number and vector of a non-existing IRQ/NMI interrupt) can be handed over to the CPU.

- $IRQ0_IRQHC$ byte write access:

8-bit (byte) width write access to $IRQ0_IRQHC$ register triggers the hold clear of partly specified IRQ number.

■ **Parameters Affected**

All part numbers of the MBEF226 series are affected.

■ **Trigger Conditions**

1. Enabled IRQ[n] is selected for interrupt service (no other interrupt with higher priority pending and $IRQ0_IRQPLn < IRQPLM$) and $IRQ0_IRQPLM$ is changed to equal or lower value than $IRQ0_IRQPLn$ before $IRQ0_IRQHS$ is set (point in time when CPU reads the interrupt vector address).
2. Priorities of active IRQ/NMI are changed during interrupt priority evaluation.
3. IRQ/NMI Hold Bit is cleared during interrupt priority evaluation.
4. $IRQ0_IRQHC$ write access with 8-bit access width.

■ **Root Cause**

1. Not all inputs of priority encoder are latched during interrupt processing (period from start of priority evaluation until handover to CPU), in this case priority level mask $IRQ0_IRQPLM$.
2. Not all inputs of priority encoder are latched during interrupt processing (period from start of priority evaluation until handover to CPU), in this case priority level $IRQ0_IRQPL0\sim 127$, resp. $IRQ0_NMIPL0\sim 7$.
3. Not all inputs of priority encoder are latched during interrupt processing (period from start of priority evaluation until handover to CPU), in this case hold status $IRQ0_IRQHS0\sim 15$ cleared by $IRQ0_IRQHC$, resp. $IRQ0_NMIHS$ cleared by $IRQ0_NMIHC$.
4. Write strobes for the relevant 2 Bytes of $IRQ0_IRQHC$ are evaluated by OR instead of AND which causes byte write access effects change on full 16 Bit.

■ **Workaround**

Refer to [Workaround for IUNIT Interrupt Handling Problem on page 413](#).

■ **Fix Status**

Cypress is proposing software workaround specified in [Workaround for IUNIT Interrupt Handling Problem on page 413](#). Hardware redesigns are not planned.

7. IUNIT Nesting Level Status Problem

■ **Description**

The IUNIT Nesting Level Status Register problem was found in the logic of the IUNIT on MBEF226 series. Because of this problem the IUNIT Nesting Level Status Register ($IRQ0_NESTL$) is not working as specified.

■ **Problem Conditions**

At least one of the following conditions must occur:

- Handover of IRQ vector address to CPU (by VIC protocol) and clearing of IRQ Hold status (by CPU executing ISR) occurs in the same clock cycle
- Handover of NMI vector address to CPU (by CPU reading the $IRQ0_NMIVAS$ register) occurs one clock cycle before clearing of NMI Hold status (by CPU executing NMI handler).

■ **Affected Devices**

All part numbers of the MBEF226 series are affected.

■ **Root Cause**

$IRQ0_NESTL:IRQNL$:

If handover of IRQ vector address to CPU (by VIC protocol) and clearing of IRQ Hold status (by CPU executing ISR) occurs in the same clock cycle, then $IRQ0_NESTL:IRQNL$ is incremented (if it is =0) or decremented (if it is !=0), but its value should not be changed.

$IRQ0_NESTL:NMINL$:

If handover of NMI vector address to CPU (by CPU reading the $IRQ0_NMIVAS$ register) occurs one clock cycle before clearing of NMI Hold status (by CPU executing NMI handler) then $IRQ0_NESTL:NMINL$ is incremented (if it is =0) or decremented (if it is !=0), but its value should not be changed.

■ **Workaround**

Do not evaluate the value returned by reading IUNIT Nesting Level Status Register ($IRQ0_NESTL$).

If software needs information about the current nesting level, a variable counter can be implemented which is incremented/decremented in the interrupt handler entry/exit code.

■ **Fix Status**

Cypress is proposing above software workaround. Hardware redesigns are not planned.

8. 1.2V LVD VDP3 Supply Problem

■ **Description**

The 1.2V Low Voltage Detection – VDP3 Supply problem was found in the MBEF226 series in the behavior of the 1.2V Low Voltage Detection (1.2V LVD, which is supervising the 1.2V core supply VDD) which is linked to the VDP3 supply voltage.

Because of this problem, the 1.2V LVD may not output power-good even if VDD supply is above set limit of LVD.

This may cause prevention of system startup after power-on and reset release and/or wrong 1.2V LVD behavior (Reset/Interrupt) at RUN and PSS mode.

■ **Problem Conditions**

The problem may occur at the following conditions:

- VDD is above set limits of 1.2V LVD (set by default to 0.8V lower limit at reset)
- 1.2V LVD is enabled (enabled by default at reset)
- VDP3 supply is smaller than 2.2V

■ **Affected Devices**

All part numbers of the MBEF226 series are affected.

■ **Root Cause**

The band-gap reference (BGR) of 1.2V LVD (supervising 1.2V core supply VDD) is connected to VDP3 supply.

If VDP3 supply is <2.2V then 1.2V LVD may not output power-good even if VDD supply is above set limit of LVD.

■ **Workaround**

Keep VDP3 supply $\geq 2.2V$ for correct operation of 1.2V LVD (at device startup and in RUN/PSS modes).

If 1.2V LVD is disabled at:

- RUN mode SYSC_RUNLVDCFGR.LVDE12 := 0, and
- PSS mode: SYSC_PSSLVDCFGR.LVDE12 := 0,

then VDP3 can be lower than 2.2V, but consider behavior as described in [3V IO Domain ESD Diode on page 390](#).

■ **Fix Status**

No fixes planned.

9. SHE AXI Master Address Mask Problem

■ **Problem Definition**

The SHE AXI Master Address Mask problem was found in the AXI Master Interface on the MB9EF226 series.

In case Input Channel Master is configured in a way the transfer will start in the address ranges:

- 0x00900000 - 0x009FFFFFF
- 0x00FE0000 - 0x00FEFFFF

the first burst will be executed starting at the configured address. The transfer will continue after the completion of the first burst at address 0x00FF0000.

In case Input Channel Master is configured in a way the transfer will start in the address ranges

- 0x01100000 - 0x011FFFFFF
- 0x017E0000 - 0x017EFFFF

the first burst will be executed starting at the configured address. The transfer will continue after the completion of the first burst at address 0x017F0000.

In case Input Channel Master is configured in a way the transfer will start outside the address ranges

- 0x00900000 - 0x009FFFFFF
- 0x00FE0000 - 0x00FEFFFF

But crossing these address ranges, the transfer will be performed till address 0x010FFFFFF and continue with next burst at address 0x00FF0000.

In case Input Channel Master is configured in a way the transfer will start outside the address ranges

- 0x01100000 - 0x011FFFFFF
- 0x017E0000 - 0x017EFFFF

but crossing these address ranges, the transfer will be performed till address 0x010FFFFFF and continue with next burst at address 0x017F0000.

■Parameters Affected

All part numbers of the MB9EF226 series are affected.

■Trigger Condition

- Problem may occur if all of the following conditions are met:
Secure boot for TCFlash or any SHE AXI Master read operation is used.

Note Secure boot uses SHE AXI Master implicitly.

- Above operation includes access to any of the following address ranges:
 - 0x00900000 - 0x009FFFFFF
 - 0x00FE0000 - 0x00FEFFFF
 - 0x01100000 - 0x011FFFFFF
 - 0x017E0000 - 0x017EFFFF

■Rootcause

The current implementation of the SHE AXI Interface masks the address range between large and small sectors. The size of the masking window overlaps with Flash address range 0x00900000 - 0x009FFFFFF, 0x00FE0000 - 0x00FEFFFF, 0x01100000 - 0x011FFFFFF and 0x017E0000 - 0x017EFFFF.

■Workaround

- Store code protected by Secure Boot either in address range 0x01000000 - 0x010FFFFFF or 0x017F0000 - 0x017FFFFFF.
- Do not access 0x00900000 - 0x009FFFFFF, 0x00FE0000 - 0x00FEFFFF, 0x01000000 - 0x010FFFFFF or 0x017F0000 - 0x017FFFFFF via SHE AXI Master IF

■Fix Status

No fixes planned.

10.SCT Compare Value Update Limitation

■Problem Definition

The SCT compare value update limitation problem was found in the Slow RC, RC, Main and Sub Source Clock Timer in the MB9EF226 series.

In case a new compare value SYSC_SRCSTCPR_CMPR is captured triggered by writing '1' to SYSC_SRCSTTRG_CGCPT it could happen that the Slow RC Source Clock Timer Counter is set to an arbitrary value.

In case a new compare value SYSC_RCSTCPR_CMPR is captured triggered by writing '1' to SYSC_RCSTTRG_CGCPT it could happen that the RC Source Clock Timer Counter is set to an arbitrary value.

In case a new compare value SYSC_MAINSTCPR_CMPR is captured triggered by writing '1' to SYSC_MAINSTTRG_CGCPT it could happen that the Main Source Clock Timer Counter is set to an arbitrary value.

In case a new compare value SYSC_SUBSTCPR_CMPR is captured triggered by writing '1' to SYSC_SUBSTTRG_CGCPT it could happen that the Sub Source Clock Timer Counter is set to an arbitrary value.

■Parameters Affected

All part numbers of the MB9EF226 series are affected.

■Trigger Conditions

Problem may occur for Slow RC Source Clock Timer if all of the following conditions are met:

- SRC source clock timer runs with compare value "old value"
- SYSC_SRCSTCPR_CMPR is set to "new value"
- SYSC_SRCSTTRG_CGCPT set to '1' trigger compare value update
- Bitwise AND of "new value" and "old value" is equal to 0 and neither "new value" nor "old value" equal to 0.

By hard reset "old value" is initialized to 0x0001.

Problem may occur for RC Source Clock Timer if all of the following conditions are met:

- RC Source Clock Timer runs with compare value "old value"
- SYSC_RCSCTCPR_CMPR is set to "new value"
- SYSC_RCSCTTRG_CGCPT set to '1' trigger compare value update
- Bitwise AND of "new value" and "old value" is equal to 0 and neither "new value" nor "old value" equal to 0.

By hard reset "old value" is initialized to 0x001E.

Problem may occur for Main Source Clock Timer if all of the following conditions are met:

- Main Source Clock Timer runs with compare value "old value"
- SYSC_MAINSCTCPR_CMPR is set to "new value"
- SYSC_MAINSCTTRG_CGCPT set to '1' trigger compare value update
- Bitwise AND of "new value" and "old value" is equal to 0 and neither "new value" nor "old value" equal to 0.

By hard reset "old value" is initialized to 0x1000.

Problem may occur for Sub Source Clock Timer if all of the following conditions are met:

- Sub Source Clock Timer runs with compare value "old value"
- SYSC_SUBSCTCPR_CMPR is set to "new value"
- SYSC_SUBSCTTRG_CGCPT set to '1' trigger compare value update
- Bitwise AND of "new value" and "old value" is equal to 0 and neither "new value" nor "old value" equal to 0.

By hard reset "old value" is initialized to 0x0400.

■ **Rootcause**

The current implementation of the Source Clock Timer generates an asynchronous reset for the Source Clock Timer Counter in case the updated compare value is 0. This condition could be met for a short period of time when the compare value register in the Source Clock Timer capture the new compare value and generate a glitch at the reset of the counter registers. The width of this glitch does not guarantee a valid reset. As a result of this glitch, it is unpredictable which of the counter register bits is reset and which is not.

■ **Workaround**

For changing the compare value of a Source Clock timer from effective "old value" to a "new value", ensure the following conditions is true: "old value" & "new value" != 0

■ **Fix Status**

No fixes planned.

11.Flash Execution Limitation

■ **Description**

The Flash Code Execution Limitation problem was found in Flash Interface in MBEF226 series.

In case device is secured and code execution is done from following address areas in TCFlash:

SA0/SA1: 0x00FF0000 - 0x00FF3FFF (TCM)/ 0x017F0000 - 0x017F3FFF (AXI), a pre-fetch abort exception occurs.

■ **Parameters Affected**

All part numbers of the MBEF226 series are affected.

■ **Problem Conditions**

The problem occurs when device is secured and a code fetch is done from following addresses in TC Flash

0x00FF0000 - 0x00FF3FFF (TCM)/ 0x017F0000 - 0x017F3FFF (AXI)

■ **Cause of Failure**

The current implementation of the flash security for protecting code execution from address space reserved for Main SDR and TCFlash SDR uses for comparison of the access area the CPU address translated into flash address. As limits there are used the lowest and highest CPU address without reflecting the interleaved arrangement of the flash sectors.

So data access for code fetch within in the address range FA=0x0000 to 0x20DF for TCFlash A and range FA=0x0000 to 0x209F for TCFlash B is rejected and leads to pre-fetch abort exception.

Code fetch is done 64-Bit aligned therefore always a Flash address from sector 0 is used for comparison. Due to the interleaved arrangement of sector 0, sector 1 in the CPU address space this prevents to use sector 1 for code execution too.

Interleaved arrangement of Flash sectors in CPU Address Map

Sequential arrangement of the sectors in the flash

TCM Address	AXI Address	Flash Sectors	
...			
0x00FF3FFF 0x00FF01C0	0x017F3FFF 0x017F01C0	SA1	SA0
0x00FF01BF 0x00FF0000	0x017F01BF 0x017F0000	SDR	SDR
...			

FA	TCFlash A
...	
0x3FFF 0x20E0	SA1
0x20DF 0x2000	SDR
0x1FFF 0x00E0	SA0
0x00DF 0x0000	SDR

Example TCFlash macro A:

0x017F0000 - 0x017F01BF (AXI) shall be non-executable if device is secured. The address comparison is done after translation to sequential flash addresses:

0x017F0000 --> 0x0000

0x017F01BF --> 0x20DF

Any code fetch (after translation) from flash address 0x0000 - 0x20DF will be prohibited, which effectively covers 0x0000 - 0x3FFF area since code fetches are always done with 64-bit width.

A correct implementation would need to compare the access with two areas:

0x0000 - 0x00DF and 0x2000 - 0x20DF

■ **Workaround**

None, but read accesses are not prohibited, hence the affected regions can be used for constants.

■ **Fix Status**

No fixes planned.

12. Automatic ADC Input Disable Problem

■ Description

The Automatic ADC Input Disable problem was found in port pin multiplexing in MBEF226 series.

Intended function: For pins with an ADC input, the digital input buffer is disabled irrespective of the PPC_PCFGRIj:PIE value if the corresponding ADC channel is enabled, i.e., if the corresponding bit of the ADCn_ER32/ADCn_ER10 register is set to '1'.

Problem:

On MBEF226 series:

Using ADC input of pin P0_40 de-activates the digital inputs of pin P0_15 and P0_40.

Using ADC input of pin P2_41 de-activates the digital inputs of pin P0_08 and P2_41.

Using ADC input of pin P2_42 de-activates the digital inputs of pin P0_09 and P2_42.

Using ADC input of pin P2_43 de-activates the digital inputs of pin P0_10 and P2_43.

Using ADC input of pin P2_44 de-activates the digital inputs of pin P0_11 and P2_44.

Using ADC input of pin P2_45 de-activates the digital inputs of pin P0_12 and P2_45.

Using ADC input of pin P2_46 de-activates the digital inputs of pin P0_13 and P2_46.

Using ADC input of pin P2_47 de-activates the digital inputs of pin P0_14 and P2_47.

■ Affected Devices

All part numbers of the MBEF226 series are affected.

■ Problem Conditions

The problem occurs if the following conditions are met

On MBEF226 series:

- Pin P0_40 is used as ADC input function (configuring the corresponding pin as ADC input with setting ADC0_ER32.ADE15 to '1')
- and
- Pin P0_15 is used as GPIO INPUT function or Peripheral INPUT function
- or
- Pin P2_41 is used as ADC input function (configuring the corresponding pin as ADC input with setting ADC0_ER32.ADE08 to '1')
- and
- Pin P0_08 is used as GPIO INPUT function or Peripheral INPUT function
- or
- Pin P2_42 is used as ADC input function (configuring the corresponding pin as ADC input with setting ADC0_ER32.ADE09 to '1')
- and
- Pin P0_09 is used as GPIO INPUT function or Peripheral INPUT function
- or
- Pin P2_43 is used as ADC input function (configuring the corresponding pin as ADC input with setting ADC0_ER32.ADE10 to '1')
- and
- Pin P0_10 is used as GPIO INPUT function or Peripheral INPUT function
- or
- Pin P2_44 is used as ADC input function (configuring the corresponding pin as ADC input with setting ADC0_ER32.ADE11 to '1')
- and
- Pin P0_11 is used as GPIO INPUT function or Peripheral INPUT function
- or
- Pin P2_45 is used as ADC input function (configuring the corresponding pin as ADC input with setting ADC0_ER32.ADE12 to '1')
- and

- Pin P0_12 is used as GPIO INPUT function or Peripheral INPUT function
or
- Pin P2_46 is used as ADC input function (configuring the corresponding pin as ADC input with setting ADC0_ER32.ADE13 to '1')
and
- Pin P0_13 is used as GPIO INPUT function or Peripheral INPUT function
or
- Pin P2_47 is used as ADC input function (configuring the corresponding pin as ADC input with setting ADC0_ER32.ADE14 to '1')
and
- Pin P0_14 is used as GPIO INPUT function or Peripheral INPUT function

■ **Rootcause**

Misconnection of the ADC channel enable and the digital input disable of affected pins.

■ **Workaround**

None, don't use affected pin pairs as ADC input and as GPIO INPUT or Peripheral INPUT at same time.

■ **Fix Status**

No fixes planned.

13.RTC Configuration Synchronization Problem

■ **Description**

The RTC Configuration Synchronization problem was found in synchronization architecture of the RTC in MB9EF226 series.

In the case of two consecutive write accesses to RTC_WTCR register, it could happen that the values UPCAL, SCAL[2:0], ENUP, ACAL are synchronized as random values into the CLK_MAIN clock domain or cannot be changed inside CLK_MAIN clock domain until next hard reset occurrence.

In the case of two consecutive write accesses to RTC_WTCR register it could happen that the values RCKSEL[1:0], CSM are synchronized as random value into the RTC clock domain or cannot be changed inside RTC clock domain until next hard reset occurrence.

That UPCAL, SCAL[2:0], ENUP, ACAL, RCKSEL[1:0], CSM cannot be changed in CLK_MAIN or RTC clock domain cannot be identified by reading back RTC_WTCR.

■ **Parameters Affected**

All part numbers of the MB9EF226 series are affected.

■ **Problem Conditions**

The problem could occur if the following conditions are met:

Two write accesses to RTC_WTCR are performed within less than 10 times the period of slowest clock out of CLK_MAIN, previous and new CLK_S_RTC and CLK_CFG_PD1 in between.

Figure 28. RTC Timer Module Diagram

■ **Cause of Failure**

The synchronization of the random data for UPCAL, SCAL[2:0], ENUP, ACAL into the CLK_MAIN clock domain is caused if the data sampled in CLK_CFG_PD1 domain changes at sampling by CLK_MAIN.

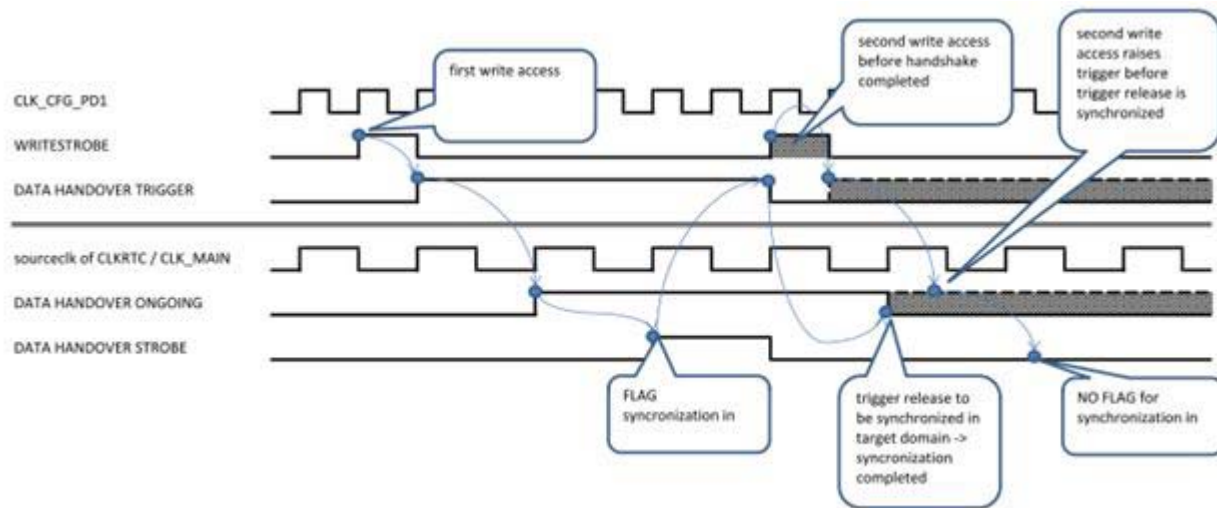

The synchronization of the random data for RCKSEL[1:0], CSM into the RTC clock domain is caused if the data sampled in CLK_CFG_PD1 domain changes at sampling by CLK_S_RTC.

The locking of UPCAL, SCAL[2:0], ENUP, ACAL inside CLK_MAIN clock domain until hard reset occurrence is caused if the second write access occurs during handshake of synchronization flag.

The locking of RCKSEL[1:0], CSM inside RTC clock domain until hard reset occurrence is caused if the second write access occurs during handshake of synchronization flag.

The waveform in Figure 29 shows the principle of handshake interference which causes a deadlock.

Figure 29. Handshake Synchronization

■ **Workaround**

□ Ensure that after a write accesses to RTC_WTCR there is no write to RTC_WTCR for 10 times the period of slowest clock out of CLK_MAIN, previous and new CLK_S_RTC and CLK_CFG_PD1.

1. Write RTC_WTCR
2. Read RTC_WTCR to ensure that first write has arrived at RTC due to CPU store buffer.
3. Wait 10 times the period of slowest clock out of CLK_MAIN, previous and new CLK_S_RTC and CLK_CFG_PD1 before next write access to RTC_WTCR.

■ **Fix Status**

No fixes planned.

14.PSS Wakeup Problem

■ Description

The PSS Wakeup problem was found at wakeup from Power Saving State (PSS) in MB9EF226 series.

At wakeup from PSS, an unexpected Non-Maskable Interrupt (NMI) will appear if the PSS profile settings meet certain conditions.

■ Affected Devices

All part numbers of the MB9EF226 series are affected.

■ Condition

The problem will occur if the following conditions are met:

The device is in PSS state and receives a wakeup event

AND the RC oscillator is OFF in PSS state (SYSC_PSSCKSRER:RCOSCEN=0)

AND the Low Voltage Detection (LVD) threshold settings differ between RUN and PSS profile

```
(
  (SYSC_RUNLVDCFGR:SV12[2:0] != SYSC_PSSLVDCFGR:SV12[2:0])
OR  (SYSC_RUNLVDCFGR:SV33[2:0] != SYSC_PSSLVDCFGR:SV33[2:0])
OR  (SYSC_RUNLVDCFGR:SV50[2:0] != SYSC_PSSLVDCFGR:SV50[2:0])
).
```

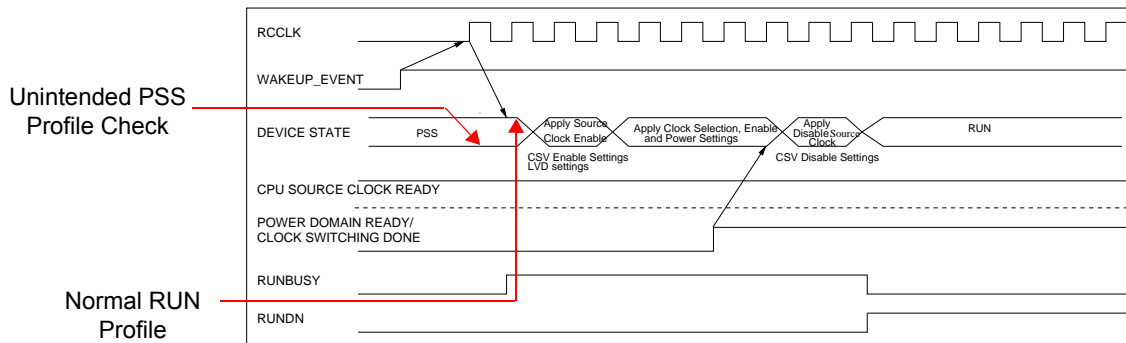

■ Cause of Failure

Before the transition from RUN to PSS state, the PSS profile is checked for validity. If the PSS profile is not valid, SYSC_SYSTSR:IPPAPSS would be set and a transition to PSS would not be possible.

When the profile was good and the device has entered the PSS state, following happens after a wakeup event:

1. The fast RC oscillator is started (in case it was OFF in PSS)
2. An unintended PSS profile check is executed, caused by a logic bug
3. The RUN profile is checked normally as described in hardware manual

Figure 30. PSS to RUN State Switching

Reference: Hardware Manual FCR4-Cluster-MN707-00001-1v2-E.pdf section "2.3.2.6 PSS to RUN State Switching", page 294

Generally, the unintended PSS profile check has no effect because of the PSS profile was already checked at the preceding RUN to PSS transition. However, at startup, the following invalid PSS profile setting rule builds an exception:

- An LVD is switched on (i.e. the LVD is off in APP profile and on in PSS profile) or an LVD threshold is changed (i.e. the LVD threshold differs between APP and PSS profiles) when the RC oscillator is disabled in the PSS profile. This check is necessary to make sure the RC clock is available for the stabilization time of the LVD

Reference: Hardware manual FCR4-Cluster-MN707-00001-1v2-E.pdf
section "Invalid PSS profile settings for RUN to PSS transitions", page 298

After wakeup, the APP profile of LVD already holds the settings for RUN state. Now the mentioned rule compares the LVD threshold settings (APP differ from PSS?), and if the RC oscillator is disabled in PSS, the rule is fulfilled, the PSS profile error flag SYSC_SYSEERRR:PSSERRIF is set and NMI is triggered.

■ Workaround

- Do not use the combination of settings mentioned in the above [Condition](#).
- If the mentioned combination of settings was applied, execute and handle this particular NMI exception by ignoring it once after every wake-up.

■ Fix Status

No fixes planned

15.Undefined Data under Certain Conditions when Reading the Flash Memory

■ Overview

This functional limitation is that invalid data may be read from the TCM interface when changing the wait state setting of the Flash interface or at concurrent TCM port and AXI port accesses to the Flash memory of MB9EF226 series microcontrollers.

■ Affected Devices

All part numbers of the MB9EF226 series are affected.

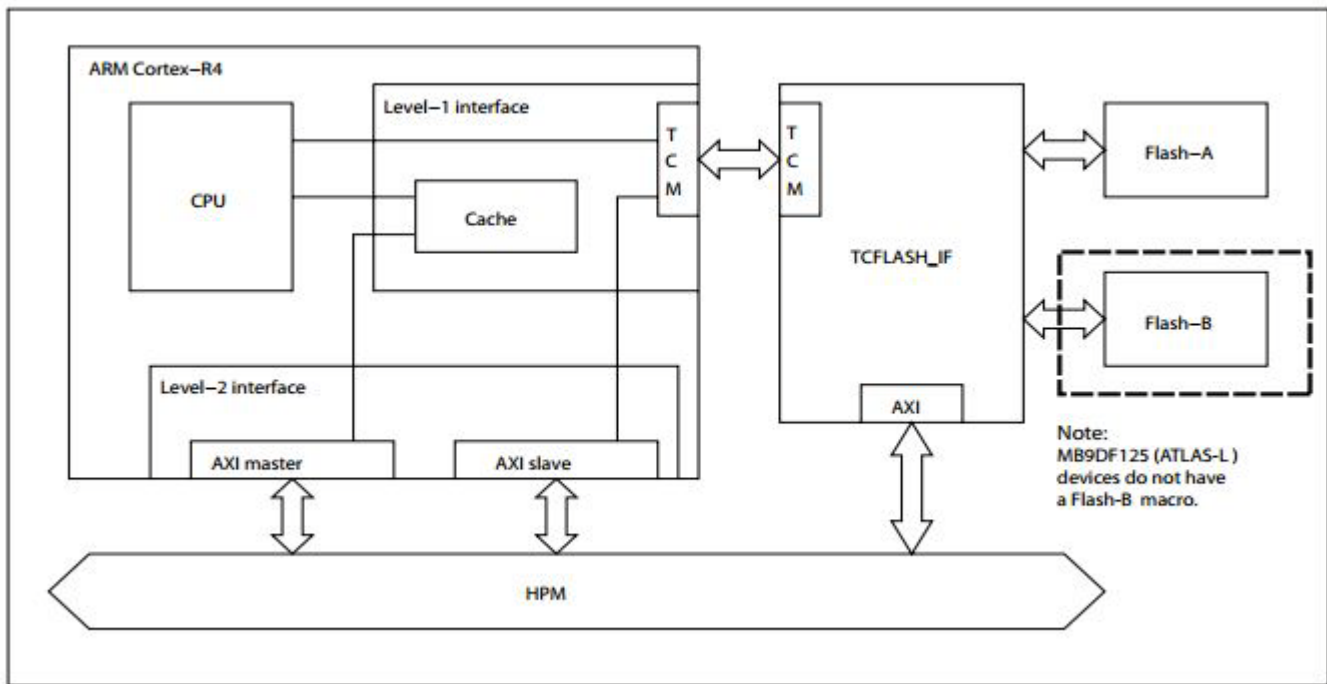

■ Details of the Limitation

The Flash memory is connected via the TCFLASH_IF to the CPU and the High Performance bus Matrix (HPM) as shown in [Figure 31](#). The TCM port of this interface is the direct connection to the TCM port of the CPU and the AXI port is the connection to the HPM.

Invalid data may be read from the TCM port of the Flash memory at the following two conditions:

- The wait state setting of the Flash interface can be changed by writing to register TCFCFG_FCFGR:FAWC[1:0]. If the Wait state setting is changed while the Flash is read via the TCM interface, then invalid data may be read from the TCM port of the Flash interface.
- If the Flash is read via the TCM port while there is a concurrent access via the AXI port, then invalid data may be read from the TCM port of the Flash interface.

Figure 31. Connection of Flash Memory

■ Workaround

For issue no. 1, avoid changing the wait state setting of the Flash interface while reading from the Flash interface via the TCM port. Use the default setting of TCFCFG_FCFGR:FAWC[1:0] instead. The default setting is 1 wait state which is sufficient to run the CPU with the maximum specified clock.

In case it is unavoidable to change wait state settings, make sure there are no accesses to the Flash memory via the TCM port. For example, execute code from a routine previously copied to RAM.

For issue no. 2, access the Flash memory only in one of the following ways:

- a. Access the Flash memory only via the AXI interface.
- b. Access the Flash memory only via the TCM interface.

In this case, ensure no xmaster is accessing the Flash memory via the AXI interface. Accesses by other masters than the CPU can be detected by using the Memory Protection Unit (MPU) for AXI and the MPU for AHB. See FCR4 Cluster Series Hardware Manual for details how to use the MPU.

To allow access by other masters to the Flash memory, such masters should use the address range of the AXI slave interface of the CPU where the TCFLASH is also mapped. That would use the arbitration logic within the CPU and the Flash interface would face only accesses through its TCM port. For details of the memory map, refer to FCR4 Cluster Series Hardware Manual, chapter 1, symbols AXI_SLAVE_CORE0_TCM_FLASH_SMALL_SECTORS, AXI_SLAVE_CORE0_TCM_FLASH_LARGE_SECTORS

■ Fix Status

No fixes planned

16. Undefined Port Pin State while Core Supply (VDD) is Unavailable

■ Overview

This functional limitation is possibly undefined port pin (Pi_{jj}) states while the 1.2V core supply VDD is unavailable with the MB9EF226 series. From assertion of VDP3 or VDP5 until VDD is within the recommended operating conditions the port pin (Pi_{jj}) states maybe undefined.

■ Affected Devices

Table 96. Affected Part Numbers

Items	Affected Part Numbers
1	MB9EF226PSC-ESE2 (Trace variant)
2	MB9EF226PMC-ESE2 (Engineering Samples)
3	MB9EF226EPMC-ESE2 (Engineering Samples)
4	MB9EF226LPMC-ESE2 (Engineering Samples)
5	MB9EF226PMC-GSE2
6	MB9EF226EPMC-GSE2
7	MB9EF226LPMC-GSE2

■ Details of the Limitation

Refer to [Limitation Details Undefined Port Pin State while Core Supply \(VDD\) is Unavailable](#) on page 414.

■ Workaround

It is necessary to analyze the application design to identify the impact of the undefined behavior of the port pins during the power-up phase, i.e. in the time between VDP3/VDP5 is powered until VDD is powered.

In case the application allows that VDP3/VDP5 is powered and VDD is not powered for a longer time, this must also be analyzed.

Use the new die version available. [Table 97](#) provides the new part numbers.

■ Fix Status

Cypress intends to release new die versions of the affected devices that prevent these issues.

Contact Cypress sales representative for more information.

Table 97. New Part Numbers

Items	New Part Numbers
1	MB9EF226BPMC-GSE2
2	MB9EF226EBPMC-GSE2
3	MB9EF226LBPMC-GSE2

Check items when using the new die revisions:

When using the new die revisions, the following items must be ensured for the corrective action being effective:

1. In all situations, in which VDD is out of the recommended operating conditions, the MODE pin must be tied to 'L'.
In a running application this is usually the case, as the MODE pin must be 'L' at release of RSTX to configure the microcontroller device in User Mode (see section 2.3 "Operation of the System Controller" of FCR4 32-Bit Microcontroller FCR4 Cluster Series Hardware Manual (002-09388)).
2. When the MODE pin is not tied to 'L', for example, when the device shall enter board test mode, VDD must be in the recommended operating conditions.

Ordering Information

Table 98 lists the MB9EF226 series key package features and ordering codes. The table contains only the parts that are currently available. If you do not see what you are looking for, contact your local sales representative. For more information, visit the Cypress website at www.cypress.com and refer to the product summary page at <http://www.cypress.com/products>.

Note

46. These devices are subject to the limitation shown in [Limitation Details Undefined Port Pin State while Core Supply \(VDD\) is Unavailable](#) on page 414.

Appendix

Workaround for IRQ Unit Register Read Timing Issue

General Considerations

It is assumed that for normal operation of the MCU and most use cases it is not necessary to read back any I-Unit registers, i.e. the application software e.g. knows which vector addresses are configured, which priorities are set and which IRQ channels are enabled. Furthermore, it is assumed that for IRQ handling the application enables the ARM VIC port which is not affected by the read timing issue.

It is not necessary to poll the I-Unit lock status bit (IRQ0_CSR_LST) after unlocking/locking the I-Unit. This bit does not indicate any I-Unit internal time consuming operations. Its purpose is to inform the application about the current lock state so that exceptions caused by double unlocking or locking can be avoided. This can also be implemented with software means (e.g. semaphore).

For debugging during development or error logging purposes it may be useful to read certain status registers from the I-Unit (e.g. IRQ0_IRQST, IRQ0_EAN) which still can be done but it must be regarded that the gathered information may not be reliable.

Considering above mentioned assumptions the only functionality that is affected by the read timing issue is the NMI handling. FCR4 MCUs by default use the ARM "high exception vectors" option with exception vector table located at address 0xFFFF0000. This area is implemented as ROM and its contents are not changeable. The instruction placed at the FIQ exception vector (**Note** FIQ and NMI are used synonymously throughout the document) will read from the NMIVAS mirror register at address 0xFFFEFBFC to retrieve the branch target. Due to the read timing issue the target address is not reliable and the read must be prevented.

Following two workarounds exist to overcome this situation and still provide NMI functionality:

- Workaround #1: Using Memory Protection Unit ' preventing the read from NMIVAS mirror
 - Workaround #2: Using ARM "low exception vector" option ' allowing to replace the instruction at FIQ exception vector
- All described preparatory steps in these workarounds (e.g. MPU configuration) must be completed before application enables NMIs (clearing of 'F'-bit in CPU Current Program Status Register).

If these workarounds are used, it is also not necessary to initialize the NMI specific I-Unit registers (NMI priorities, NMI vectors)

Software samples are provided to demonstrate both workarounds:

- Workaround #1: fcr4_nmi_mpu_mbxxxx-vxx
- Workaround #2: fcr4_nmi_low_exception_mbxxxx-vxx

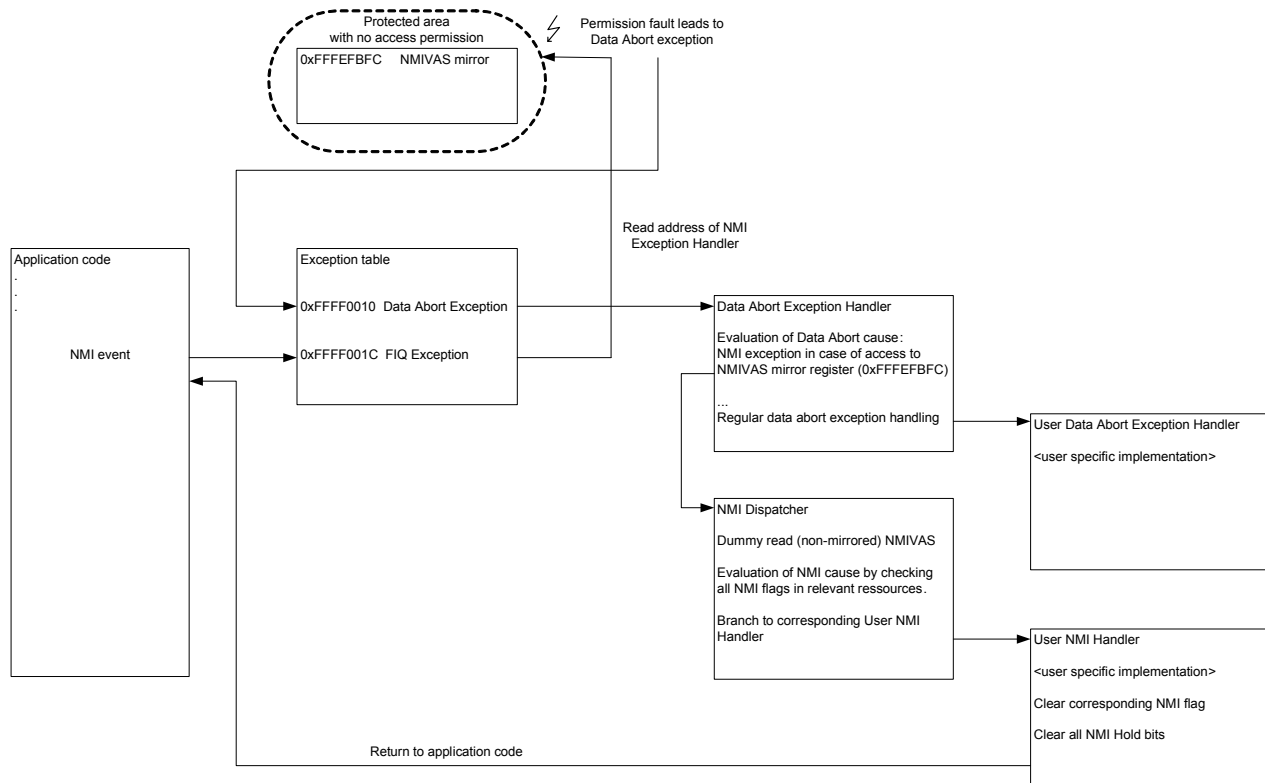

Workaround #1 (MPU)

Overview

This workaround aims to detect the read access to the IRQ0_NMIVAS mirror register from the instruction at the FIQ exception vector. The NMIVAS mirror register is located at address 0xFFFEFBFC which will be secured by a memory protection region supported by the ARM core MPU.

The flowchart below introduces the process of the workaround when the application code is interrupted by an NMI event.

Figure 32. Workaround #1 Software Flow

Description

1. Each non-maskable interrupt will cause an FIQ exception and the instruction at address 0xFFFF001C is executed. The instruction reads the vector for the NMI exception handler. This vector is determined by the I-Unit and made available via NMIVAS register and because of the specified hardware fault in the I-Unit cannot be read reliably.
To prevent a branch to a corrupted NMI vector address, the access to NMIVAS mirror register at address 0xFFFFEFBFC must be protected by an ARM MPU region.
2. When the FIQ exception instruction accesses the NMIVAS mirror register, a Data Abort exception will occur because of the MPU protection.
3. After the Data Abort handler is entered, the Data Fault Status Register (DFSR) and Data Fault Address Register (DFAR) which are located in System Control coprocessor and the CPU Link Register (R14) are evaluated to determine whether the Data Abort was caused by the occurrence of an NMI.
Conditions for NMI cause:
 - Data Fault Status Register
DFSR[10,3:0] = 0b01101 (Permission Fault)
DFSR[11] = 0 (read access)
 - Data Fault Address Register
DFAR = 0xFFFFEFBFC (NMIVAS mirror register)
 - Link Register R14_abt = 0xFFFF0024 shows that an NMI caused the abort (0xFFFF001C + 0x8)
 Before evaluation starts all CPU registers modified by the code are pushed on Data Abort stack (R13_abt).
4. There are two cases depending on this evaluation result:
 - a. In case not all conditions are true, the Data Abort was not caused by the occurrence of an NMI.
The modified registers are restored from the stack and the Data Abort handler branches to the user's Data Abort handler ("branch without link" -> Link Register is not modified). This behavior is transparent for the user's Data Abort handler which can be written assuming that the handler is directly executed from a Data Abort exception.

- b. In case all conditions are true, the Data Abort was caused by the occurrence of an NMI.

Data Fault Status and Data Fault Address register are explicitly cleared to prevent a repetitive NMI handling in case an NMI occurred shortly after a "normal" Data Abort. After that, the modified registers are restored from the stack and the CPU mode is changed from "Abort" to "FIQ".

The program continues at NMI Dispatcher function where a dummy read to the NMIVAS register is done, because this read has the I-Unit internal effect of deasserting the nFIQ CPU signal and setting the NMI Hold bit of the NMI which has won I-Unit priority decision.

Finally, the NMI cause must be evaluated. This is done by checking all NMI flags in the corresponding peripheral resources (availability may vary for different FCR4 derivatives). As it is not possible to reliably read the I-Unit ECC Double Bit Error NMI flag (IRQ0_EEI_EENS), the software must assume that this is the NMI cause in case no other NMI is present. Once the NMI cause has been detected, the software can branch to the user's NMI handler. Before doing the "branch without link", the stack and registers should be restored (if used by NMI Dispatcher), as the user handler will directly return to the program location where the NMI occurred.

5. The user NMI handler must be changed as described in "Changes to User NMI Handler" on page 411. It will directly return to the application code.

ARM MPU Configuration

The MPU is a part of Cortex-R4 MCU and can be configured via System Control Coprocessor. It controls the accesses to defined memory regions with the configuration of permission rights.

For protection of NMIVAS mirror register, this function will be used in following way:

The setup of MPU is done by defining the following:

- Region number
- Region access permissions
- Region size and enable setting
- Region base address

The region number with the highest priority ('11') must be chosen.

The access permission must be set to 'No Access' in User and in Privileged Mode.

The region size (bit 5..1) is set to minimum size (32 byte) which will not influence any other used memory area. Bit 0 enables the configured MPU setup.

It must be ensured that the region base address is 32 byte aligned and the NMIVAS mirror address is within the given region size.

In addition, two more settings in the System Control Register (also located in System Control Coprocessor) must be done for activating the MPU function:

- M (bit 0) = 1: MPU enable
- BR (bit 17) = 1: MPU background region enable

Refer to the ARM Cortex-R4 Technical Reference Manual and the provided software sample for information on how to configure and enable the MPU.

Configuration Sequence

The following configuration sequence for this workaround is recommended:

1. Reset (High Exception Vectors active, FIQ/NMI masked, IRQ masked).
2. Configure MPU to prohibit access to NMIVAS mirror register.
3. Enable NMI processing in CPU (clear 'F'-bit in CPSR register).
4. Configure IRQ vector table, priority levels and channel enable status in I-Unit.
5. Enable VIC port (to enable IRQ processing via not-affected VIC port).
6. Enable IRQ processing in I-Unit (IRQ0_CSR_IRQEN).
7. Enable IRQ processing in CPU (clear 'I'-bit in CPSR register).

Workaround Limitations

The following limitations need to be considered, if this workaround is used:

- NMI dispatcher and all called NMI handlers must not allow NMI nesting.

If NMIs would be re-enabled (clearing of 'F'-bit in CPU Current Program Status Register), another NMI exception could occur. In case the NMI flag of the already handled NMI is evaluated again by the new/nested NMI Dispatcher function, the same handler will be called again. Further error scenarios are imaginable which can also result in some inconsistent state.

- Return from a "normal" Data or Prefetch Abort may not be possible.

It can happen that while a "normal" Data or Prefetch Abort handler is currently executed, an NMI occurs because they are not masked on Abort exception entry. As a consequence, this NMI will lead to another Data Abort exception that overwrites the original SPSR_abt and R14_abt CPU register values, and the Fault Status Registers in the System Control Coprocessor. This makes it impossible for the user's Data or Prefetch Abort handler to return to application or correctly evaluate the circumstances (for example, program location and processor state) of the original Abort.

Basically, a similar behavior can occur on any ARMv7-R architecture if another precise Abort occurs while an Abort handler is executed.

Workaround #2 (Low Exception)

Overview

The application needs to set up an exception table at the "low exception table" location at address 0x0 (inside TCMRAM) and afterwards make this the active table. With this solution, the instruction at the FIQ exception vector can be chosen arbitrarily and the read to NMIVAS register is avoided.

Description

Preconditions

For the implementation shown in the software samples, the linker settings of the application must ensure that 64 bytes starting from address 0x0 are reserved for the low exception table and corresponding handler addresses (address area 0x00 - 0x3F).

Exception Table Setup

The exception table in ARMv7-R architecture is defined as provided in [Table 99](#).

Table 99. ARMv7-R Exception Table

Offset to Table Base (0x0 or 0xFFFF0000)	Exception Type
0x00	Reset
0x04	Undefined Instruction
0x08	Supervisor Call / (Software Interrupt)
0x0C	Prefetch Abort
0x10	Data Abort
0x14	reserved
0x18	IRQ (if VIC port disabled)
0x1C	FIQ

Typically, a LDR PC, [PC, #+/-<imm>] instruction is placed at each of these exception vectors which will do a 32-bit read at a PC-relative location and move this value to the PC (= branch to this address). In ARM terminology, the data that is read are called "literals". These literals are the addresses of the corresponding exception handler functions.

In the sample software, the exception table and literals are setup as provided in [Table 100](#).

Table 100. Exception Table Setup in Sample Software

Absolute Address	Content
0x00	don't care (on reset high exception table is getting active anyway)
0x04	LDR PC, [PC, #+0x18]
0x08	LDR PC, [PC, #+0x18]

Table 100. Exception Table Setup in Sample Software (Continued)

Absolute Address	Content
0x0C	LDR PC, [PC, #+0x18]
0x10	LDR PC, [PC, #+0x18]
0x14	don't care
0x18	LDR PC, [PC, #+0x18]
0x1C	LDR PC, [PC, #+0x18]
0x20	don't care
0x24	Address of Undefined Instruction handler
0x28	Address of Supervisor Call handler
0x2C	Address of Prefetch Abort handler
0x30	Address of Data Abort handler
0x34	don't care
0x38	Address of IRQ handler (in case VIC port disabled)
0x3C	Address of special NMI dispatcher function (see Description of NMI Dispatcher)

The offset value in the LDR PC, [PC, #+0x18] instruction regards the fact that in ARMv7-R architecture, the PC always points to the address of the currently executed instruction + 0x8 → 0x18 + 0x8 = 0x20 offset between instruction and corresponding literal.

MPU protection of low exception table (optional)

Especially when considering the probability of immature software using uninitialized NULL pointers, it is recommended to protect the low exception table and related literals against accidental write accesses by setting up a read-only MPU region for that address area.

Refer to the ARM Cortex-R4 Technical Reference Manual and the provided software sample for information on how to configure and enable the MPU.

Switching the active exception table

To make the low exception table active, the 'V' bit (bit 13) in the System Control Register of the System Control Coprocessor must be cleared.

Description of NMI Dispatcher

The same NMI Dispatcher as for Workaround #1 is also used for workaround #2.

This function executes a dummy read to the NMIVAS register, because this read has the I-Unit internal effect of deasserting the nFIQ CPU signal and setting the NMI Hold bit of the NMI which has won I-Unit priority decision. Finally, the NMI cause must be evaluated. This is done by checking all NMI flags in the corresponding peripheral resources (availability may vary for different FCR4 derivatives). As it is not possible to reliably read the I-Unit ECC Double Bit Error NMI flag (IRQ0_EEI_EENS), the software must assume that this is the NMI cause in case no other NMI is present. Once the NMI cause has been detected, the software can branch to the user's NMI handler. Before doing the "branch without link", the stack and registers should be restored (if used by NMI Dispatcher), as the user handler will directly return to the program location where the NMI occurred.

The user NMI handler must be changed as described in "[Changes to User NMI Handler](#)" on page 411.

Configuration Sequence

The following configuration sequence for this workaround is recommended:

1. Reset (High Exception Vectors active, FIQ/NMI masked, IRQ masked).
2. Create Low Exception Vector table at 0x00000000.
3. Configure MPU to protect exception vector table in TCMRAM.
4. Switch to Low Exception Vector table.
5. Enable NMI processing in CPU (clear 'F'-bit in CPSR register).
6. Configure IRQ vector table, priority levels and channel enable status in I-Unit.
7. Enable VIC port (to enable IRQ processing via not-affected VIC port).
8. Enable IRQ processing in I-Unit (IRQ0_CSR_IRQEN).
9. Enable IRQ processing in CPU (clear 'I'-bit in CPSR register).

Workaround Limitations

Following limitations need to be considered, if this workaround is used:

- NMI dispatcher and all called NMI handlers must not allow NMI nesting.

If NMIs would be re-enabled (clearing of 'F'-bit in CPU Current Program Status Register), another NMI exception could occur. In case the NMI flag of the already handled NMI is evaluated again by the new/nested NMI Dispatcher function, the same handler will be called again. Further error scenarios are imaginable which can also result in some inconsistent state.

Changes to User NMI Handler

The limitation and workarounds covered by this document result in necessary changes to the user NMI handlers.

A different NMI handler exit code is required for correct operation. Instead of only clearing the corresponding NMI Hold bit, all NMI Hold bits must be cleared (as currently set Hold Bit cannot be read back from I-Unit).

If this is not done a problem can occur in case of multiple pending NMIs. The software NMI dispatcher may have evaluated a different "winning" NMI than the I-Unit hardware logic (in case of multiple pending NMIs), because it uses the resource NMI flags to determine pending NMIs. Consequently, the NMI Hold bit would not be cleared by the user NMI handler and this prevents the I-Unit from asserting the nFIQ signal to CPU again for this still pending and not yet handled NMI.

Ordering of NMI Flag Evaluation

In the event of an NMI, no information can be read from the I-Unit, hence the NMI flag(s) of all resources that can generate NMIs need to be evaluated.

Following order of NMI flag evaluation is used in the provided software samples:

1. Low voltage detection NMI
2. System controller error NMI
3. External NMI pin
4. Watchdog NMI
5. Timing Protection Unit NMI
6. MPU DMA Access Violation NMI
7. MPU IRIS Access Violation NMI (if available)
8. MPU MLB0 Access Violation NMI (if available)
9. Bus Error Collection Unit BECU0 Access Violation (Peripheral group 0)
10. Bus Error Collection Unit BECU1 Access Violation (Peripheral group 1)
11. Bus Error Collection Unit BECU3 Access Violation (Peripheral group 3)
12. Iris Signature Unit NMI (if available)
13. MPU SHE Access violation (if available)
14. IRQ Double Error NMI

The order may be re-arranged to decrease NMI latency for certain use cases, except "IRQ Double Error NMI", which must remain on last position as it must be determined by exclusion principle.

Writing I-Unit Registers

Care must be taken when writing code for the initialization of I-Unit registers.

Any code that would result in RMW (Read-Modify-Write) accesses must be avoided. RMW accesses may be generated if register bit field types are used for assigning values.

Example:

If priority level for IRQ channel 2 shall be set to 19:

C-Code: `IRQ0_IRQPL0_IRQPL2 = 19;` **(wrong!)**

Compiler Output: 32-bit read of `IRQ0_IRQPL0` register

Modify bits belonging to `IRQPL2` bit field

32-bit write of `IRQ0_IRQPL0` register

Because the read of this RMW access is affected by the limitation, a possibility that other priority levels in the same register are getting corrupted exists.

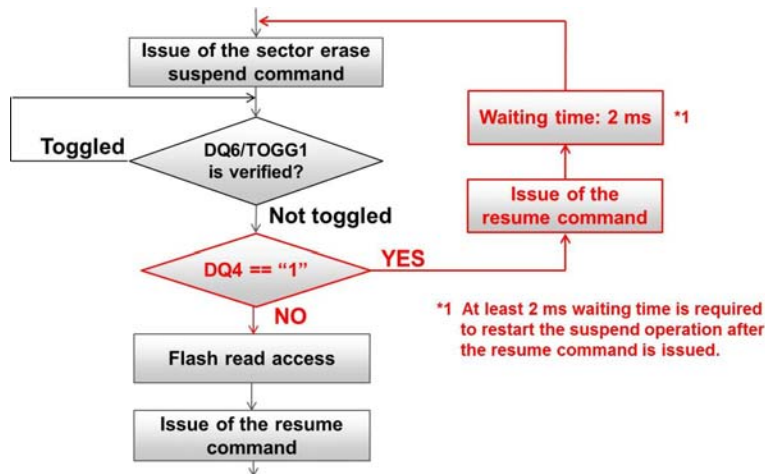

Workaround for Flash Erase Suspend Internal

To avoid this limitation, the following workaround by software is recommended.

After the flash sector erase suspend operation (issue of the suspend command + verification of DQ6/TOGG1 bit) is finished, check the hardware sequence flag DQ4 bit indicating the specific internal state which can read flash or not (see Figure 33).

If the value of DQ4 bit is "1", then issue the sector erase resume command and restart the sector erase suspend operation after the waiting time.

Figure 33. Workaround by Software

Please note the following factors of internal circuit when using the software workaround:

- At least 2 ms waiting time is required to restart the sector erase suspend operation after the resume command is issued by DQ4 = "1" (see *1 in Figure 33).
- Approximately a maximum of 10 ms would be required for DQ4 to become "0" after the suspend command is issued first.

Though DQ4 is an undefined bit on the hardware manual, it can be used to read the internal sequence state which can read from flash or not. If DQ4 = "0", it indicates the internal state which can read from flash. But if DQ4 = "1", internal circuit have not switch to the state of read flash. See Table 101, Table 102 and figure representing bit assignment of DQ4 bit for FCR4 family and FR5 family, respectively.

Table 101. Bit Assignment of Hardware Sequence Flags (Cypress Cortex R4 Family)

Read data bit no.	7	6	5	4	3	2	1	0
Hardware sequence flag	DQ7	DQ6	DQ5	DQ4	DQ3	DQ2	-	-
Read data bit no.	15	14	13	12	11	10	9	8
Hardware sequence flag	DQ15	DQ14	DQ13	-	DQ11	DQ10	-	-

Table 102. 4 Bit Assignment of Hardware Sequence Flags (FR5 Family)

Read data bit no.	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Hardware sequence flag	DQ15	DQ14	DQ13	-	DQ11	DQ10	-	-	DQ7	DQ6	DQ5	DQ4	DQ3	DQ2	-	-

Note

The following software products (all releases) are not affected by this limitation, because they do not use erase suspend:

- FCR4 MCAL (SW-MCAL31-DRV-FCR4-E01, SW-MCAL31-DRV-FCR4-E02, SW-MCAL40-DRV-FCR4-E01),
- FCR4 FEE/FLS (SW-FEEFLS-DRV-FCR4-E01, SW-FEE40-DRV-FCR4-E01)

Workaround for IUNIT Interrupt Handling Problem

1. To change the IRQ Priority Level Mask Register (IRQ0_IRQPLM), use the following workaround:
 - a. Safe sequence to change IRQ0_PLM (temporarily disable interrupt processing and perform wait until IUNIT idle)

```
SuspendAllInterrupts();          // globally disable all IRQs with
// 'I'-bit in CPU CPSR
IRQ0_UNLOCK = <unlock-key>;
IRQ0_CSR = 0;                    // setting IRQEN bit to '0'
IRQ0_CSR;                        // dummy read to generate wait cycles
// until state machine has returned to
// idle state
IRQ0_IRQPLM = <new PLM value>;
IRQ0_CSR = 1;                    // setting IRQEN bit to '1'
IRQ0_UNLOCK = <lock-key>;
ResumeAllInterrupts();          // restore previous state of 'I'-
// bit in CPU CPSR
```

- b. Extension for each ISR entry code (check if corresponding IRQ0_IRQPL[n] < current IRQ0_IRQPLM)

Pseudocode:

```
__interrupt void Interrupt_1_Handler(void)
{
    // Check if priority of current IRQ is higher (means lower value)
    // than the currently active priority level mask
    if (Interrupt_1_Prio < Current_PLM_Value)
    {
        // The interrupt is "valid" and corresponding code
        // shall be executed
        // Call user callback function, which is also responsible
        // for clearing the interrupt flag in the peripheral
        ....
    }

    // Clear Hold-Bit of Interrupt_1
    ...
}
```

IMPORTANT:

'Interrupt_1_Prio' must be determined indirectly by the called ISR and OS/application internal interrupt priority configuration variable(s).

IRQ0_IRQPL0~127 and IRQ0_IRQST:IRQSN must not be read.
(see CI707-00026-E_FCR4_IRQ_Unit_register_read_timing_issue)

Current_PLM_value must be read from OS/application internal buffer variable IRQ0_IRQPLM must not be read.
(see CI707-00026-E_FCR4_IRQ_Unit_register_read_timing_issue)

2. To avoid changing the priority level of an active IRQ interrupt, configure IRQ0_IRQPL0~127 only in initial phase before enabling interrupts by setting IRQ0_CSR.IRQEN=1.
3. With the software workaround explained in CI707-00026-E_FCR4_IRQ_Unit_register_read_timing_issue, it is not necessary to change IRQ0_NMIPL0~7.

4. IRQ Hold Clear - use following sequence to clear the bit:

```

IRQ0_UNLOCK = <unlock-key>
IRQ0_CSR = 0;           // setting IRQEN bit to '0'
IRQ0_CSR;              // dummy read to generate wait cycles
                       // until IRQ is latched in IUNIT, resp.
                       // state machine returned to idle state
IRQ0_IRQHC = <IRQ-Nr>  // clear Hold-bit of IRQ
IRQ0_CSR = 1;          // setting IRQEN bit to '1'
IRQ0_UNLOCK = <lock-key>

```

NMI Hold Clear - use following workaround:

NMI handling shall be implemented according to workarounds in C1707-00026-E_FCR4_IRQ_Unit_register_read_timing_issue (will not use any potential wrong NMI register values, as reading is prohibited anyway).

5. Perform write access to IRQ0_IRQHC only with 16-bit or 32-bit access width.

Limitation Details Undefined Port Pin State while Core Supply (VDD) is Unavailable

When the port pins (Pi_jj) are powered (i.e. depending on the IO Pin type, VDP3 or VDP5 is applied) and the core supply voltage VDD is out of the recommended operating conditions, then two issues occur:

1. the port pins (Pi_jj) may drive any state, i.e. they may show any of the following states high/low, pull-up, pull-down or high-Z instead of the intended state high-Z.
2. the states of the analog switches to connect the Stepper Motor Controller (SMC) port pins to the A/D converter may be undefined. Several switches may be in the conducting state at once and create connections between the SMC port pins. Depending on the voltage levels on the SMC port pins internal currents may flow.

This is described in more detail in the next two sections.

Undefined Port Pin State

As can be seen in [Figure 34](#), port pins Pi_jj in VDP3 and VDP5 power domain may enter undefined state while the 1.2V core supply VDD is below the recommended operating conditions.

As an example, the figure shows a system in which a VDP5 power drop is starting at T₀.

At T₁ an external supply voltage monitor asserts RSTX. This switches the port pins Pi_jj to high-Z state.

At T₂, VDP3, which was also decreasing, is out of recommended operating conditions. The port pins Pi_jj should stay in the high-Z state down to a lower VDP3 voltage. However, as they are operated outside recommended operating conditions, this is shown as X.

At T₃ VDP5 is out of recommended operating conditions. The port pins Pi_jj should stay in the high-Z state down to a lower VDP5 voltage. However, as they are operated outside recommended operating conditions, this is shown as X.

Figure 34. Undefined Port Pin Pi_jj State while VDP3/VDP5 is Powered, but VDD is not

Thereafter, also VDD is decreasing, being below the recommended operating conditions at T₄. If VDD is reaching a critical low value, the port pins Pi_jj enter undefined state. When VDP3 and VDP5 are rising again, the port pins Pi_jj remain in undefined state. At T₅ VDP5 is back in recommended operating conditions and at T₆ VDP3 is also back. Even though RSTX is still asserted, the port pins Pi_jj show the undefined state instead of the intended high-Z state. This failure case is indicated by the red rectangles.

Only when at T₇ VDD has reached a certain level (in this example: minimum value of recommended operating conditions) they are switched back to high-Z state caused by the still asserted RSTX.

Changed behavior of fixed devices in boundary scan test in user mode

Fixed devices behave differently in boundary scan test as described in following. If boundary scan test is enabled in user mode using a sequence of JTAG commands, then driving RSTX pin low during the boundary scan will force all output device pins to go to High-Z state. This also applies to the JTAG_TDO pin. Previously no output pin state change would have occurred.

Behavior of the boundary scan test if enabled through the board test mode (MODE pin = '1') is not affected by the fix.

Multiple Analog Switches of SMC Port Pins in Conducting State

When the port pins Pi_jj enter undefined state as described above, also the states of the analog switches to connect the Stepper Motor Controller (SMC) port pins to the A/D converter may be undefined. Other A/D converter switches than the ones of the SMC IOs are not affected. As the state is undefined, several switches of the SMC port pins may be in the conducting state at once and create chip internal connections between the SMC port pins. Depending on the voltage levels on the SMC port pins, internal currents may flow.

Figure 35. Current Flowing Between SMC Pins of Different State because Multiple Analog Switches are in Conducting State

The minimum resistance of the internal switches when closed is $R_{ON} = 270\Omega$.

Depending on the state of the connected pins, a current I may flow.

The maximum number of SMC output drivers is 6 channels x 4 output drivers / SMC channel = 24.

The two worst case scenarios creating the maximum currents are as follows:

- a. Worst case for one switch: One SMC output buffer is driving against all others, i.e. one SMC output driver is driving 'H', all others are driving 'L' or vice versa and all analog switches are in conducting state.

In this case the maximum current flowing through the switch of the one SMC output buffer driving against all others is:

$$I_{MAX} = \frac{VDP5_{MAX}}{R_{ON} + \frac{1}{23}R_{ON}} = \frac{5.5V}{270\Omega + \frac{1}{23}270\Omega} = 19.5mA$$

This current is still in the allowable limits for short time (some milliseconds) but will destroy the switch in case it is flowing for longer time as it is exceeding the allowable sustained current of 1mA.

- b. Worst case for overall current: 12 SMC output drivers are driving 'H', 12 SMC output drivers are driving 'L', all analog switches are in conducting state. In this case the maximum overall current is:

$$I_{MAX} = 12 \times \frac{VDP5_{MAX}}{2 \times R_{ON}} = 12 \times \frac{5.5V}{2 \times 270\Omega} \cong 12 \times 10mA = 120mA$$

This current is still in the allowable limits for short times (some ten milliseconds) but will destroy the switches in case it is flowing for longer time as the current flowing through a single switch (10mA) is exceeding the allowable sustained current of 1mA.

The maximum total current of 120mA, respectively the total power consumption $P = 120mA \times 5.5V = 660mW$ is adding to the total power consumption $PTOT$. Make sure the total power consumption $PTOT(max) = 2000mW$ at $TA = 105^\circ C$ is not exceeded.

However, as in the failure case VDD is below spec and $RSTX$ is active, all clocks are stopped and the current consumption of the microcontroller is expected to be low.
