EP5352QI/EP5362QI/EP5382QI 500/600/800mA PowerSoC Synchronous Buck Regulators With Integrated Inductor

# Product Highlights

- Revolutionary integrated inductor
- Very small solution foot print\*
- Fully RoHS compliant; MSL 3 260°C reflow
- Only two low cost components required
- 5mm x 4mm x1.1mm QFN package
- Wide 2.4V to 5.5V input range
- 500, 600, 800 mA output current versions
- $\bullet$  Less than 1  $\mu A$  standby current
- 4 MHz switching frequency
- Fast transient response
- $\bullet$  Very low ripple voltage; 5mV  $_{p\text{-}p}$  typical
- 3 Pin VID Output Voltage select
- External divider option
- Dynamically adjustable output
- Designed for Low noise/EMI
- Short circuit, UVLO, and thermal protection

### **Product Overview**

The Ultra-Low-Profile EP53X2QI product family is targeted to applications where board area and profile are critical. EP53X2QI is a complete power conversion solution requiring only two low cost ceramic MLCC caps. Inductor, MOSFETS, PWM, and compensation are integrated into a tiny 5mm x 4mm x 1.1mm QFN package. The EP53x2QI family is engineered to simplify design and to minimize layout constraints. High frequency switching and internal type Ш compensation provides superior transient response. With a 1.1 mm profile, the EP53x2 is perfect for space and height limited applications.

A 3-pin VID output voltage select scheme provides seven pre-programmed output voltages along with an option for external resistor divider. Output voltage can be programmed on-the-fly to provide fast, dynamic voltage scaling.

# **Typical Application Circuit**

Figure 1. Typical application circuit.

# **Applications**

- Area constrained applications
- Mobile multimedia, smartphone & PDA
- Mobile and Cellular platforms
- VolP and Video phones
- Personal Media Players
- FPGA, DSP, IO & Peripherals

# Absolute Maximum Ratings

CAUTION: Absolute Maximum ratings are stress ratings only. Functional operation beyond recommended operating conditions is not implied. Stress beyond absolute maximum ratings may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

# **Pin Description**

Figure 2. Pin description, top view.

 $V_{\rm IN}$  (Pin 1,2): Input voltage pin. Supplies power to the IC.  $V_{\rm IN}$  can range from 2.4V to 5.5V.

**Input GND**: (Pin 3): Input power ground. Connect this pin to the ground terminal of the input capacitor. Refer to Layout Recommendations for further details.

**Output GND**: (Pin 4): Power ground. The output filter capacitor should be connected to this pin. Refer to Layout recommendations for further detail.

Vout (Pin 5,6,7): Regulated output voltage.

**NC** (Pin 8,9,10,11,12,13,14): These pins should not be electrically connected to each other or to any external signal, voltage, or ground. One or more of these pins may be connected internally.

 $V_{\text{SENSE}}$  (Pin 15): Sense pin for output voltage regulation. Connect  $V_{\text{SENSE}}$  to the output voltage rail as close to the terminal of the output filter capacitor as possible.

Figure 3. Pin description, bottom view.

 $V_{FB}$  (Pin 16): Feed back pin for external divider option. When using the external divider option (VS0=VS1=VS2= high) connect this pin to the center of the external divider. Set the divider such that  $V_{FB} = 0.603V$ .

**VS0,VS1,VS2** (Pin 17,18,19): Output voltage select. VS0=pin19, VS1=pin18, VS2=pin17. Selects one of seven preset output voltages or choose external divider by connecting pins to logic high or low. Logic low is defined as  $V_{LOW} \leq 0.4V$ . Logic high is defined as  $V_{HIGH} \geq 1.4V$ . Any level between these two values is indeterminate. (refer to section on output voltage select for more detail).

**ENABLE** (Pin 20): Output enable. Enable = logic high, disable = logic low. Logic low is defined as  $V_{LOW} \le 0.2V$ . Logic high is defined as  $V_{HIGH} \ge 1.4V$ . Any level between these two values is indeterminate.

**Thermal Pad.** Thermal pad to remove heat from package. Connect to surface ground pad and PCB internal ground plane.

#### Efficiency vs Output Current

# **Detailed Description**

#### **Functional Overview**

The EP53x2QI family is a complete DCDC converter solution requiring only two low cost MOSFET switches. PWM MLCC capacitors. Gate-drive. controller. compensation. and inductor are integrated into the tiny 5mm x 4mm x 1.1mm package to provide the smallest footprint possible while maintaining hiah efficiency and high performance. The converter uses voltage mode control to provide the simplest implementation and high noise immunity. The device operates at a 4 MHz switching frequency. The high switching frequency allows for a wide control loop excellent bandwidth providing transient performance. The 4 MHz switching frequency enables the use of very small components making possible this unprecedented level of integration.

Altera Enpirion's proprietary power MOSFET technology provides very low switching loss at frequencies of 4 MHz and higher, allowing for the use of very small internal components, and very wide control loop bandwidth. Unique magnetic design allows for integration of the inductor into the very low profile 1.1mm package. Integration of the inductor virtually eliminates the design/layout issues normally associated with switch-mode DCDC converters. All of this enables much easier and faster integration into various applications to meet demanding EMI requirements.

Output voltage is chosen from seven preset values via a three pin VID voltage select scheme. An external divider option enables the selection of any voltage in the 0.6 to  $V_{IN}$  -  $V_{dropout}$ . This reduces the number of components that must be qualified and reduces inventory problems. The VID pins can be toggled on the fly to implement glitch free dynamic voltage scaling.

Protection features include under-voltage lockout (UVLO), over-current protection (OCP), short circuit protection, and thermal overload protection.

#### **Integrated Inductor**

Altera has introduced the world's first product family featuring integrated inductors. The EP53x2QI family utilizes a low loss, planar construction inductor. The use of an internal inductor localizes the noises associated with the output loop currents. The inherent shielding

Rev H

and compact construction of the integrated inductor reduces the radiated noise that couples into the traces of the circuit board. Further, the package layout is optimized to reduce the electrical path length for the AC ripple currents that are a major source of radiated emissions from DCDC converters. The integrated inductor significantly reduces parasitic effects that can harm loop stability, and makes layout very simple.

#### Soft Start

Internal soft start circuits limit in-rush current when the device starts up from a power down condition or when the "ENABLE" pin is asserted "high". Digital control circuitry limits the  $V_{OUT}$  ramp rate to levels that are safe for the Power MOSFETS and the integrated inductor.

The EP53x2QI have two soft start operating modes. When VOUT is programmed using a preset voltage in VID mode, the device has a constant slew rate. When the EP53x2QI is configured in external resistor divider mode, the device has a constant VOUT ramp time. Output voltage slew rate and ramp time is given in the Electrical Characteristics Table.

Excess bulk capacitance on the output of the device can cause an over-current condition at startup.

When operating in VID mode, the maximum total capacitance on the output, including the output filter capacitor and bulk and decoupling capacitance, at the load, is given as:

 $C_{OUT\_TOTAL\_MAX} = C_{OUT\_Filter} + C_{OUT\_BULK} = 350 \text{uF}$ When the EP53x2QI output voltage is programmed using and external resistor divider the maximum total capacitance on the output is given as:

 $C_{OUT_TOTAL_MAX} = 6.253 \times 10^{-4} / V_{OUT}$  Farads

The above number and formula assume a no load condition at startup.

#### **Over Current/Short Circuit Protection**

The current limit function is achieved by sensing the current flowing through a sense P-MOSFET which is compared to a reference current. When this level is exceeded the P-FET is turned off and the N-FET is turned on, pulling  $V_{OUT}$  low. This condition is maintained for a period of 1mS and then a normal soft start is initiated. If the over current condition still persists, this cycle will repeat in a "hiccup" mode.

#### Under Voltage Lockout

During initial power up an under voltage lockout circuit will hold-off the switching circuitry until the input voltage reaches a sufficient level to insure proper operation. If the voltage drops below the UVLO threshold the lockout circuitry will again disable the switching. Hysteresis is included to prevent chattering between states.

#### Enable

The ENABLE pin provides a means to shut down the converter or enable normal operation. A logic low will disable the converter and cause it to shut down. A logic high will enable the converter into normal operation. In shutdown mode, the device quiescent current will be less than 1 uA. The ENABLE pin must not be left floating.

#### Thermal Shutdown

When excessive power is dissipated in the chip, the junction temperature rises. Once the junction temperature exceeds the thermal shutdown temperature the thermal shutdown circuit turns off the converter output voltage thus allowing the device to cool. When the junction temperature decreases by 15C°, the device will go through the normal startup process.

# Application Information

Rev H

#### **Output Voltage Select**

To provide the highest degree of flexibility in choosing output voltage, the EP53x2QI family uses a 3 pin VID, or Voltage ID, output voltage select arrangement. This allows the designer to choose one of seven preset voltages, or to use an external voltage divider. Internally, the output of the VID multiplexer sets the value for the voltage reference DAC, which in turn is connected to the non-inverting input of the error amplifier. This allows the use of a single feedback divider with constant loop gain and optimum compensation, independent of the output voltage selected.

Table 1 shows the various VS0-VS2 pin logic states and the associated output voltage levels. A logic "1" indicates a connection to  $V_{IN}$  or to a "high" logic voltage level. A logic "0" indicates a connection to ground or to a "low" logic voltage level. These pins can be either hardwired to  $V_{IN}$  or GND or alternatively can be driven by standard logic levels. These pins must not be left floating.

VS2	VS1	VS0	V <sub>OUT</sub> 3.3 2.5 2.8 1.2
0	0	0	3.3
0	0	1	2.5
0	1	0	2.8
0	1	1	1.2
1	0	0	3.0
1	0	1	1.8
1	1	0	2.7
1	1	1	External

#### **External Voltage Divider**

As described above, the external voltage divider option is chosen by connecting the VS0, VS1, and VS2 pins to  $V_{IN}$  or logic "high". The EP53x2QI uses a separate feedback pin,  $V_{FB}$ , when using the external divider. VSENSE must be connected to  $V_{OUT}$  as indicated in Figure 5.

#### Table 1. Voltage select settings.

Figure 5. External Divider.

The output voltage is selected by the following formula:

$$V_{OUT} = 0.603V \left(1 + \frac{Ra}{Rb}\right)$$

 $R_a$  must be chosen as 200K $\Omega$  to maintain loop gain. Then  $R_b$  is given as:

$$R_{b} = \frac{1.2x10^{5}}{V_{OUT} - 0.603} \Omega$$

### Dynamically Adjustable Output

The EP53x2QI are designed to allow for dynamic switching between the predefined VID voltage levels. The inter-voltage slew rate is optimized to prevent excess undershoot or overshoot as the output voltage levels transition. The slew rate is identical to the soft-start slew rate of 3V/mS.

Dynamic transitioning between internal VID settings and the external divider is not allowed.

### Power-Up/Down Sequencing

During power-up, ENABLE should not be asserted before VIN. During power down, the VIN should not be powered down before the ENABLE. Tying PVIN and ENABLE together

during power-up or power-down meets this requirement.

#### **Pre-Bias Start-up**

The EP53x2QI does not support startup into a pre-biased condition. Be sure the output capacitors are not charged or the output of the EP53x2QI is not pre-biased when the EP53x2QI is first enabled.

### Input and Output Capacitors

The **input** capacitance requirement is as follows:

EP5352QI, EP5362QI = 2.2uF

EP5382QI = 4.7uF

Altera recommends that a low ESR MLCC capacitor be used. The input capacitor must use a X5R or X7R or equivalent dielectric formulation. Y5V or equivalent dielectric formulations lose capacitance with frequency, bias, and with temperature, and are not suitable for switch-mode DC-DC converter input and output filter applications.

The **output** capacitance requirement is a minimum of 10uF. The control loop is designed to be stable with up to 60uF of total output capacitance without requiring modification of the control loop. Capacitance above the 10uF minimum should be added if the transient performance is not sufficient using the 10uF. Altera recommends a low ESR

MLCC type capacitor be used. The output capacitor must use a X5R or X7R or equivalent dielectric formulation. Y5V or equivalent dielectric formulations lose capacitance with frequency, bias, and temperature and are not suitable for switch-mode DC-DC converter input and output filter applications.

# LAYOUT CONSIDERATIONS\*

\*Optimized PCB Layout file downloadable from <u>http://www.altera.com/enpirion</u> to assure first pass design success.

**Recommendation 1:** Input and output filter capacitors should be placed as close to the EP53x2QI package as possible to reduce EMI from input and output loop AC currents. This reduces the physical area of the Input and Output AC current loops.

**Recommendation 2**: DO NOT connect GND pins 3 and 4 together. Pin 3 should be used for the Input capacitor local ground and pin 4 should be used for the output capacitor ground. The ground pad for the input and output filter capacitors should be isolated ground islands and should be connected to system ground as indicated in recommendation 3 and recommendation 5.

**Recommendation 3**: Multiple small vias (0.25mm after copper plating) should be used to connect ground terminals of the Input capacitor and the output capacitor to the system ground plane. This provides a low inductance path for the high-frequency AC currents, thereby reducing ripple and suppressing EMI (see Fig. 5, Fig. 6, and Fig. 7).

Recommendation 4: The large thermal pad underneath the component must be connected to the system ground plane through as many thermal vias as possible. The vias should use 0.33mm drill size with minimum one ounce copper plating (0.035mm plating thickness). This provides the path for heat dissipation from the converter.

**Recommendation 5:** The system ground plane referred to in recommendations 3 and 4 should be the first layer immediately below the surface layer (PCB layer 2). This ground plane should be continuous and un-interrupted below the converter and the input and output capacitors that carry If it is not possible to make PCB layer 2 a continuous ground plane, an large AC currents. uninterrupted ground "island" should be created on PCB layer 2 immediately underneath the EP53x2QI and its input and output capacitors. The vias that connect the input and output capacitor grounds, and the thermal pad to the ground island, should continue through to the PCB GND layer as well.

Recommendation 6: As with any switch-mode DC/DC converter, do not run sensitive signal or control lines underneath the converter package.

Figure 6 shows an example schematic for the EP53x2QI using the internal voltage select. In this example, the device is set to a  $V_{OUT}$  of 1.2V (VS2=0, VS1=1, VS0=1).

Figure 6. Example application, Vout=1.2V.

Figure 7 shows an example schematic using an external voltage divider. VS0=VS1=VS2= "1". The resistor values are chosen to give an output voltage of 2.6V.

Figure 7. Schematic showing the use of external divider option, Vout = 2.6V.

Figure 8 shows two example board layouts. Note the placement of the input and output capacitors. They are placed close to the device to minimize the physical area of the AC current loops. Note the placement of the vias per recommendation 3.

Vias to Ground Plane

Figure 8. Example layout showing PCB top layer, as well as demonstrating use of vias from input, output filter capacitor local grounds, and thermal pad, to PCB system ground.

# Design Considerations for Lead-Frame Based Modules

#### Exposed Metal on Bottom Of Package

Altera has developed a break-through in package technology that utilizes the lead frame as part of the electrical circuit. The lead frame offers many advantages in thermal performance, in reduced electrical lead resistance, and in overall foot print. However, it does require some special considerations.

As part of the package assembly process, lead frame construction requires that for mechanical support, some of the lead-frame metal be exposed at the point where wire-bond or internal passives are attached. This results in several small pads being exposed on the bottom of the package.

Only the large thermal pad and the perimeter pads are to be mechanically or electrically connected to the PC board. The PCB top layer under the EP53x2QI should be clear of any metal except for the large thermal pad. The "grayed-out" area in Figure 9 represents the area that should be clear of any metal (traces, vias, or planes), on the top layer of the PCB.

**NOTE:** Clearance between the various exposed metal pads, the thermal ground pad, and the perimeter pins, meets or exceeds JEDEC requirements for lead frame package construction (JEDEC MO-220, Issue J, Date May 2005). The separation between the large thermal pad and the nearest adjacent metal pad or pin is a minimum of 0.20mm, including tolerances. This is shown in Figure 10.

Figure 9. Exposed metal and mechanical dimensions of the package. The gray area represents the bottom metal no-connect area. This area should be clear of any traces, planes, or vias, on the top layer of the PCB.

JEDEC minimum separation = 0.20

Figure 10. Exposed pad clearances; the Altera Enpirion lead frame package complies with JEDEC requirements.

Figure 11. Recommended PCB Solder Mask Openings.

Figure 12. Package mechanical dimensions.
