

NCP372

Positive and Negative Overvoltage Protection Controller with Internal Low R_{on} NMOS FETs and Status \overline{FLAG}

The NCP372 is able to disconnect systems from its output pin when wrong operating conditions are detected at its input. The system is both positive and negative overvoltage protected up to ± 28 V.

This device uses internal NMOS, and therefore, no external device is necessary, reducing the system cost and the PCB area of the application board.

The NCP372 is able to instantaneously disconnect the output from the input, due to integrated Low R_{on} Power NMOS, if the input voltage exceeds the overvoltage threshold (OVLO) or undervoltage threshold (UVLO).

At powerup (\overline{EN} pin = low level), the V_{out} turns on 30 ms after the V_{in} exceeds the undervoltage threshold.

The NCP372 provides a negative going flag (\overline{FLAG}) output, which alerts the system that a fault has occurred.

In addition, the device has ESD-protected input (15 kV Air) when bypassed with a 1.0 μ F or larger capacitor.

Features

- Overvoltage Protection up to 28 V
- Negative Voltage Protection down to -28 V
- Reverse Current Blocking
- On-Chip Low $R_{DS(on)}$ NMOS Transistor: Typical 130 m Ω
- Overvoltage Lockout (OVLO)
- Undervoltage Lockout (UVLO)
- Soft-Start
- Alert \overline{FLAG} Output
- Shutdown \overline{EN} Input
- Compliance to IEC61000-4-2 (Level 4)
8.0 kV (Contact)
15 kV (Air)
- ESD Ratings: Machine Model = B
Human Body Model = 2
- 12 Lead LLGA 3x3 mm Package
- This is a Pb-Free and Halogen-Free Device

Applications

- Cell Phones
- Camera Phones
- Digital Still Cameras
- Personal Digital Assistant
- MP3 Players
- GPS

PIN FUNCTION DESCRIPTION

| Pin | Name | Type | Description |
|-------|------------------------|--------|--|
| 1, 2 | IN | POWER | Input voltage pins. These pins are connected to the power supply. A 1 μ F low ESR ceramic capacitor, or larger, must be connected between these pins and GND. The two IN pins must be hardwired to common supply. |
| 3 | GND | POWER | Main Ground |
| 4 | RES | INPUT | Reserved pin. This pin must be connected to GND. |
| 5 | RES | INPUT | Reserved pin. This pin must be connected to GND. |
| 6 | RES | INPUT | Reserved pin. This pin must be connected to GND. |
| 7 | GND | POWER | This pin must be directly hardwired to GND or through a pull down resistor with a 1 M Ω maximum value. |
| 8 | NC | NC | Not Connected |
| 9 | $\overline{\text{EN}}$ | INPUT | Enable Pin. The device enters into shutdown mode when this pin is tied to a high level. In this case the output is disconnected from the input. To allow normal functionality, the $\overline{\text{EN}}$ pin shall be connected to GND to a pull-down or to an I/O pin. This pin does not have an impact on the fault detection. |
| 10 | FLAG | OUTPUT | Fault Indication Pin. This pin allows an external system to detect fault condition. The pin goes low when input voltage exceeds OVLO threshold, drops below UVLO threshold, or internal temperature exceeds thermal shutdown limit. Since the pin is open drain functionality, an external pull up resistor to VBat must be added (10 k Ω minimum value). |
| 11,12 | OUT | OUTPUT | Output Voltage Pin. This pin follows IN pins when “no input fault” is detected. The output is disconnected from the V _{IN} power supply when the input voltage is under the UVLO threshold or above OVLO threshold or thermal shutdown limit is exceeded. |
| 13 | PAD1 | POWER | The PAD1 is used to dissipate the internal MOSFET thermal energy and must be soldered to an isolated PCB area. The area must not be connected to any potential other than a completely isolated one. See PCB Recommendations on page 10. |

MAXIMUM RATINGS

| Rating | Symbol | Value | Unit |
|--|------------------------------------|--|-----------------------------|
| Minimum Voltage (IN to GND) | V _{min_{in}} | -30 | V |
| Minimum Voltage (All others to GND) | V _{min} | -0.3 | V |
| Maximum Voltage (IN to GND) | V _{max_{in}} | 30 | V |
| Maximum Voltage (OUT to GND) | V _{max_{out}} | 10 | V |
| Maximum Voltage (All others to GND) | V _{max} | 7 | V |
| Maximum DC Current | I _{max} | 2.5 | A |
| Thermal Resistance, Junction-to-Air, (Note 1) | R _{θJA} | 200 | $^{\circ}\text{C}/\text{W}$ |
| Operating Ambient Temperature Range | T _A | -40 to +85 | $^{\circ}\text{C}$ |
| Storage Temperature Range | T _{STG} | -65 to +150 | $^{\circ}\text{C}$ |
| Junction Operating Temperature | T _J | 150 | $^{\circ}\text{C}$ |
| ESD Withstand Voltage (IEC 61000-4-2) Human Body Model (HBM), Model = 2, (Note 2) Machine Model (MM) Model = B, (Note 3) | V _{esd} | 15kV air, 8kV contact 2000V 200V | kV V V |
| Moisture Sensitivity | MSL | Level 1 | |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The R _{θ JA} is highly dependent on the PCB heat sink area (connected to PAD1). See PCB recommendation paragraph.
2. Human Body Model, 100 pF discharged through a 1.5 k Ω resistor following specification JESD22/A114.
3. Machine Model, 200 pF discharged through all pins following specification JESD22/A115.

NCP372

ELECTRICAL CHARACTERISTICS ($V_{in} = 5\text{ V}$, Minimum/Maximum limits at $-40^{\circ}\text{C} < T_A < +85^{\circ}\text{C}$ unless otherwise noted. Typical values are at $T_A = +25^{\circ}\text{C}$)

| Characteristics | Symbols | Conditions | Min | Typ | Max | Unit |

Operation

The NCP372 provides overvoltage protection for positive and negative voltages, up to 28 V or down to -28 V. The negative protection is ensured by an internal Low $R_{DS(on)}$ NMOS FET. A second internal Low $R_{DS(on)}$ NMOS FET protects the systems (i.e.: charger) connected on the V_{out} pin, against positive overvoltage. At powerup, with \overline{EN} pin = low, the output rises t_{on} seconds after the input overtakes the undervoltage UVLO (Figure 3). The NCP372 provides a \overline{FLAG} output, which alerts the system that a fault has occurred. The \overline{FLAG} signal rises t_{start} seconds after the output signal rises. \overline{FLAG} pin is an open drain output.

Undervoltage Lockout (UVLO)

To ensure proper operation under any condition, the device has a built-in undervoltage lockout (UVLO) circuit. During V_{in} positive going slope, the output remains disconnected from input until V_{in} voltage is 2.7 V nominal. The \overline{FLAG} output remains low as long as V_{in} does not reach UVLO threshold. This circuit has a built in hysteresis to provide noise immunity to transient conditions.

Overvoltage Lockout (OVLO)

To protect connected systems on V_{out} pin from overvoltage, the device has a built-in overvoltage lockout (OVLO) circuit. During overvoltage condition, the output remains disabled until the input voltage exceeds 6.3 V.

\overline{FLAG} output remains low until V_{in} is higher than OVLO. This circuit has a built in hysteresis to provide noise immunity to transient conditions.

\overline{FLAG} Output

The NCP372 provides a \overline{FLAG} output, which alerts external systems that a fault has occurred.

This pin goes low as soon the OVLO threshold is exceeded or when the V_{in} level is below the UVLO threshold. When V_{in} level recovers normal condition, \overline{FLAG} goes high, after t_{start} delay following the output response. The pin is an open drain output, thus a pullup resistor (typically 1.0 M Ω , minimum 10 k Ω) must be provided to V_{CC} . The \overline{FLAG} level always reflects V_{in} status, even if the device is turned off ($\overline{EN} = 1$).

\overline{EN} Input

To enable normal operation, the \overline{EN} pin shall be forced low or connected to ground. A high level on the pin, disconnects OUT pin from IN pin. \overline{EN} does not overdrive an OVLO or UVLO fault.

Negative Voltage and Reverse Current

The built-in NMOS protects the downstream system from negative voltages occurring on IN pin down to -28 V. The same NMOS avoids reverse currents that could discharge the battery.

When a fault occurs, the output is disconnected from IN pin and \overline{FLAG} goes low.

NCP372

Figure 17. State Machine

Thermal Shutdown protection

In case of internal overheating, the integrated thermal shutdown protection turns off the internal MOSFETs in order to instantaneously decrease the device temperature. The thermal threshold has been set at 150°C FLAG then goes low to inform the MCU.

As the thermal hysteresis is 30°C, the MOSFETs will turn on as soon the device temperature falls below 120°C.

If the fault event is still present, the temperature increase engages the thermal shutdown again until the fault event disappears.

PCB Recommendations

Since the NCP372 integrates 2.5 A N-MOSFETs, PCB rules must be respected to properly evacuate the heat out of the silicon.

From an applications standpoint, PAD1 of the NCP372 package should be connected to an isolated PCB area to increase the heat transfer if necessary.

In any case, PAD1 should be not connected to any other potential or GND other than the isolated extra copper surface.

To assist in the design of the transfer plane connected to PAD1, Figure 18 shows the copper area required with respect to $R_{\theta JA}$.

Figure 18. Copper heat Spread Area

ESD Tests

The NCP372 conforms to the IEC61000-4-2, level 4 on the Input pin. A 1 μ F (I.E Murata GRM188R61E105KA12D) must be placed close to the IN pins. If the IEC61000-4-2 is not a requirement, a 100 nF/25 V must be placed between IN and GND.

The above configuration supports 15 kV (Air) and 8 kV (Contact) at the input per IEC61000-4-2 (level 4).

Please refer to Figure 19 for the IEC61000-4-2 electrostatic discharge waveform.

Figure 19. $I_{peak} = f(t)$ /IEC61000-4-2

NCP372

R_{DS(on)} and Dropout

The NCP372 includes two internal low R_{DS(on)} N-MOSFETs to protect the system, connected on OUT pin, from overvoltage, negative voltage and reverse current protection. During normal operation, the R_{DS(on)} characteristics of the N-MOSFETs give rise to low losses on V_{out} pin.

As example: R_{load} = 8 Ω, V_{in} = 5 V. R_{DS(on)} = 155 mΩ. I_{out} = 800 mA.

V_{out} = 4.905 V

NMOS Losses = R_{DS(on)} x I_{out}² = 0.155 x 0.8² = 0.0992 W

ORDERING INFORMATION

| Device | Marking | Package | Shipping† |
|---------------|-------------|---------------------|--------------------|
| NCP372MUAITXG | NCAI 372 | LLGA12 (Pb-Free) | 3000 / Tape & Reel |

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

SELECTION GUIDE

The NCP372 can be available in several undervoltage and overvoltage options. Part number is designated as follows:

NCP372MUxxTxG

↑↑ ↑↑
a b c d

| Code | Contents |
|------|--|
| a | UVLO Typical Threshold a: A = 2.7 V |
| b | OVLO Typical Threshold b: I = 6.3 V |
| c | Tape & Reel Type c: X = 3000 |
| d | d: G = Pb-Free |
